- ▶ Reality Capture Manager at JMT
- ▶ FAA Certified sUAS Remote Pilot
- ▶ Past-President of the MSS
- ▶ Education Committee Chair
- ▶ Technology Committee Chair
- ▶ Contributing Writer, xyHt Magazine
- ▶ Email: jshaw@jmt.com

THE PRIME DIRECTIVE

▶ Please silence your communicators.

Objectives

- ▶ A brief review of geodesy and datums
- ▶ Designing a control network for accuracy
- ▶ Configuring STAR*NET for optimal results
- ▶ STAR*NET commands, data entry, and data management
- ▶ Reviewing the STAR*NET results
- ▶ Understanding STAR*NET errors

What is Least Squares?

$$\begin{matrix} \sum_i \left(\frac{\partial F_i^2}{\partial x_1} w_i \right) & \sum_i \left(\frac{\partial F_i}{\partial x_1} \frac{\partial F_i}{\partial x_2} w_i \right) & \sum_i \left(\frac{\partial F_i}{\partial x_1} \frac{\partial F_i}{\partial x_3} w_i \right) & \cdots & \sum_i \left(\frac{\partial F_i}{\partial x_1} (k_i - F_i(x_{10}, x_{20}, x_{20}, \dots)) w_i \right) \\ \sum_i \left(\frac{\partial F_i}{\partial x_1} \frac{\partial F_i}{\partial x_2} w_i \right) & \sum_i \left(\frac{\partial F_i^2}{\partial x_2} w_i \right) & \sum_i \left(\frac{\partial F_i}{\partial x_2} \frac{\partial F_i}{\partial x_3} w_i \right) & \cdots & \sum_i \left(\frac{\partial F_i}{\partial x_2} (k_i - F_i(x_{10}, x_{20}, x_{20}, \dots)) w_i \right) \\ \sum_i \left(\frac{\partial F_i}{\partial x_1} \frac{\partial F_i}{\partial x_3} w_i \right) & \sum_i \left(\frac{\partial F_i}{\partial x_2} \frac{\partial F_i}{\partial x_3} w_i \right) & \sum_i \left(\frac{\partial F_i^2}{\partial x_3} w_i \right) & \cdots & \sum_i \left(\frac{\partial F_i}{\partial x_3} (k_i - F_i(x_{10}, x_{20}, x_{20}, \dots)) w_i \right) \\ \vdots & \vdots & \vdots & \ddots & \vdots \end{matrix}$$

► *Definition* - a model for the solution of an overdetermined system of equations based on the principle of least squares of observation residuals. It is used extensively in the disciplines of surveying, geodesy, and photogrammetry—the field of geomatics, collectively.

Low accuracy

High precision

Why do we
need to
adjust our
survey
data?

Least Squares Adjustment

You Are Seeking Truth, Not Moving Points

- ▶ The points are fixed on the ground.
- ▶ A geodetic control adjustment does not move the position of the points on the ground.
- ▶ A geodetic control adjustment does provide positional answers that should increasingly reflect truth with each set of new data.

Weak Network Geometry – Minimal Ties

Strong Network Geometry – Redundant Ties

Redundancy
is Critical to
Successful
Survey
Control

Wait! Aren't Other Adjustment Methods Good Enough?

- ▶ COMAR 09.13.06.03.G. Accuracy Standards.(1) The maximum allowable relative positional precision for boundary surveys shall be 0.07 feet (or 2 centimeters) plus 50 parts per million, based on the direct distance between the two corners being tested.
- ▶ What control adjustment methods result in a relative positional precision?

MDOT SHA Procedures Manual 2018

The Office of Highway Development
Plats and Surveys Division

Field Procedures Manual - 2018
Consultant Version

2. Datums and Adjustments

A. Datums: Unless specifically directed to use a different datum, all work for the MDOT SHA Plats and Surveys Division is to be completed under the following datums.

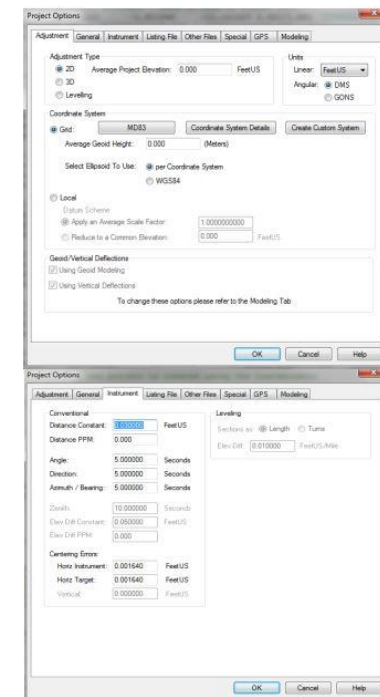

Horizontal - NAD 83/91
Vertical – NAVD 88
Geoid Model – 12B

B. Adjustments: Least squares adjustment software (StarNet, SurvNet, etc.) shall be used. The project settings, equipment tolerances and files required should follow the guidelines below.

i. Project settings: The following pages contain screen shots of StarNet Project Options settings tabs that identify information that should be included in listings report. If other adjustment software is used, similar parameters should be set. Any deviation from these settings should be reported and approved before project delivery.

ii. Equipment tolerances: Tolerance settings within the software should reflect the equipment manufactures specifications for horizontal and vertical angle accuracies. The correct distance constant and PPM values should also be used. Reasonable centering errors should also be applied in accordance with manufactures specifications.

iii. Files required with project submission: Any RW5 and DAT files both unedited and edited shall be supplied. The listing file and a network plot showing the project should also be included. If GPS data or leveling data is included with the project, all unedited and edited files should also be included.

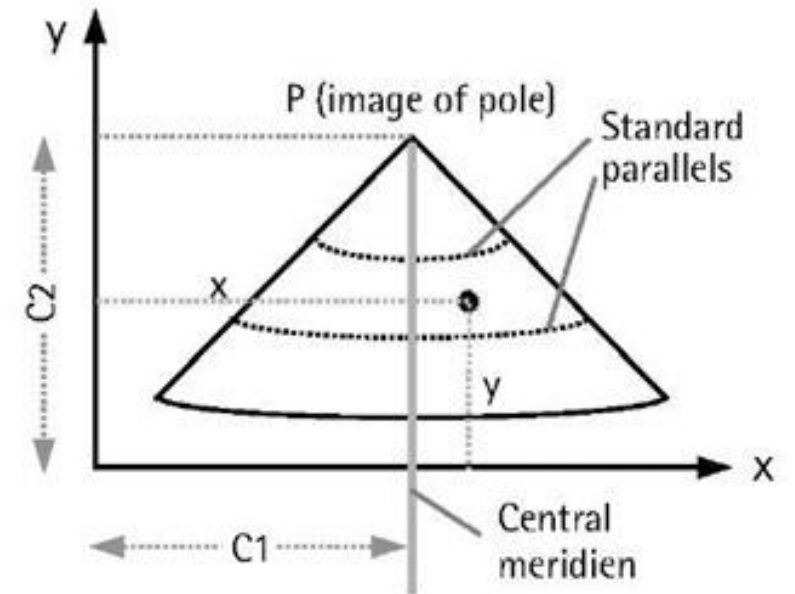

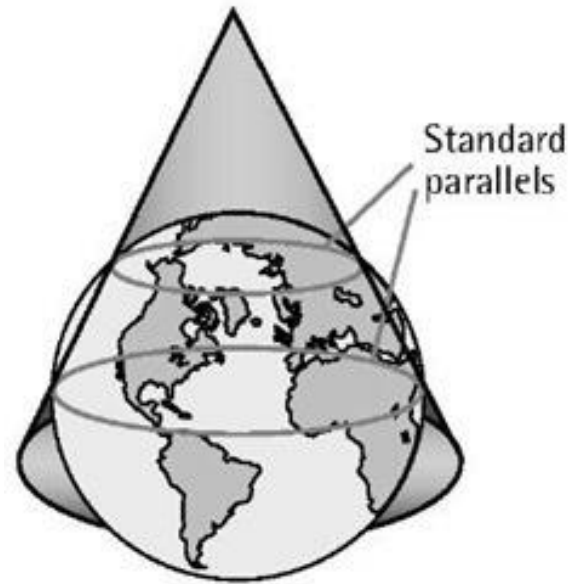

A globe with a wireframe grid of latitude and longitude lines. The globe is dark brown with a grid of thin, light-colored lines. A red vertical bar is located in the top right corner of the image. The text is overlaid on the globe.

Coordinates

HOW DO WE GET PLANAR COORDINATES ON AN ELLIPSOIDAL PLANET?

Lambert Conformal Projection

- ▶ Published in 1772 by Johann Heinrich Lambert.
- ▶ The projection minimizes scaling distortions with true scale lying along the two parallels. Scale decreases between the parallels and increases outside the parallels.

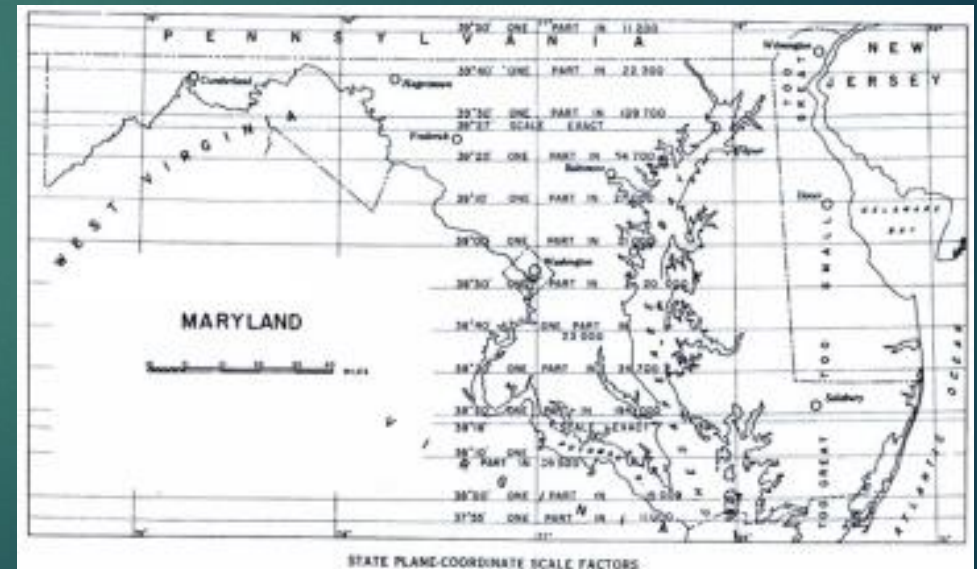

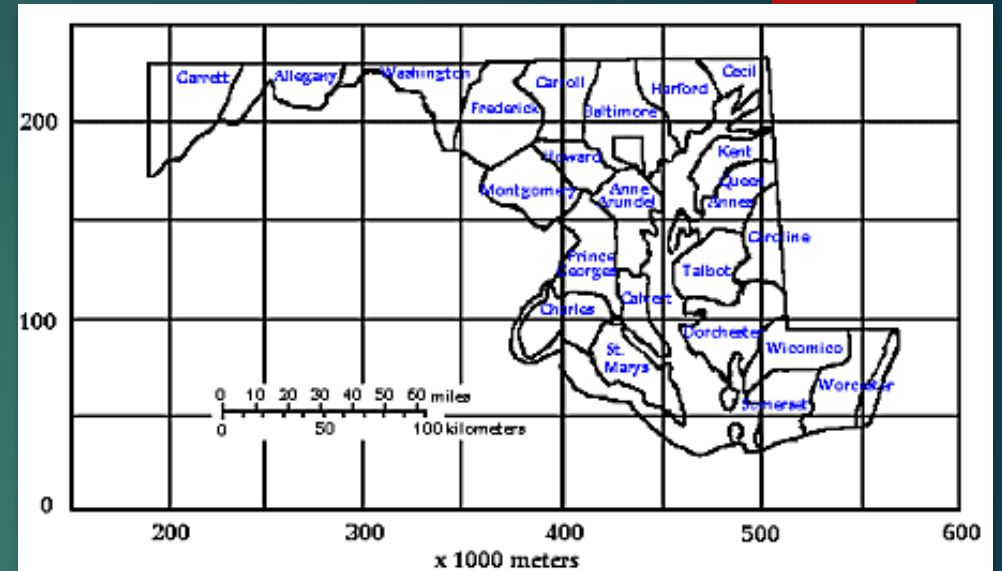

Maryland Coordinate System

Table 2. Comparison of the technical aspects of the legal definitions of the 1939 and the 1987 Maryland Coordinate Systems.

Aspect	1939 Coordinate System	1987 Coordinate System
Map Projection	Lambert conformal projection of the Clarke spheroid of 1866	Lambert conic conformal projection of the geodetic reference system of 1980
North American Datum	NAD27	NAD83
Latitude of Origin(at the 77th meridian)	37°50' North latitude	37°40' North latitude
Central Meridian	77°00' West longitude	77°00' West longitude
Standard Parallel 1	38°18' North latitude	38°18' North latitude
Standard Parallel 2	39°27' North latitude	39°27' North latitude
False Easting(at the 77th meridian)	800,000 feet	400,000 meters
False Northing(at the latitude of origin)	0 feet	0 meters
Latitude/Longitude at artificial origin (0,0)	37°48' 00.06798" N/ 79°46' 07.35361" W	37°34' 38.14264" N/ 81°31' 45.07877" W

Maryland Coordinate System

- ▶ Maryland Code, Real Property, §14-401 thru 407
- ▶ NAD83 is legislatively defined.
- ▶ Must conform to the coordinates per NGS.
- ▶ System is based on meters.
- ▶ Defines the U.S. survey foot for conversion.

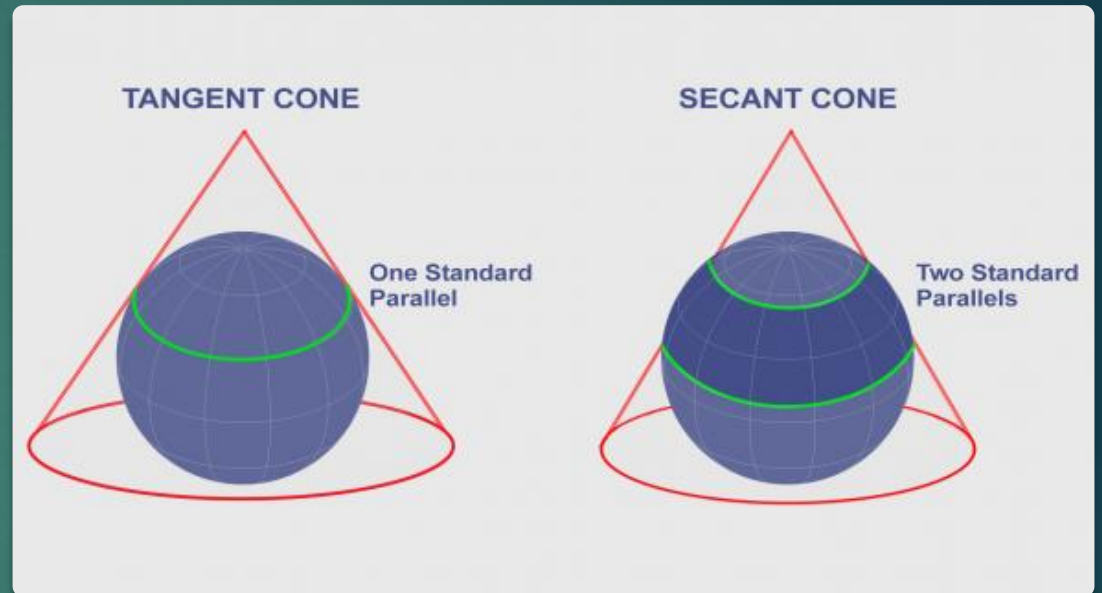

Realizations of NAD 1983

- ▶ NAD83 (1986) – initial release of 1983 tied to GRS80 and WGS84
- ▶ NAD83(1991) – localized HARN adjustment incorporating GPS observation, first 3D adjustment
- ▶ NAD83(CORS96) – national adjustment utilizing only CORS data
- ▶ NAD83(NSRS2007) epoch 2002.0 – national adjustment with GPS data only, fixed to CORS, first velocity-based system
- ▶ US National Spatial Reference System NAD 83(2011) epoch 2010.00 – velocity based geodetic system with CORS updates

The Future Maryland Coordinate System

- ▶ Based on NATRF2022 & NAPGD2022
- ▶ Maryland Code, Real Property, needs revision.
- ▶ Will rely on NSRS per NGS.
- ▶ Will use a single central parallel.
- ▶ Will use international feet for conversion.
- ▶ Will require an epoch and geoid reference.

National Geodetic Vertical Datum of 1927

- ▶ Based on Mean Sea Level as observed at 26 tide gauges in the U.S. and 5 in Canada.
- ▶ 66,315 miles of leveling. Assumed mean sea level was consistent around the globe.

North American Vertical Datum of 1988

- ▶ Continental leveling fixed to a single origin point in Pointe-au-Pere, Rimouski, Quebec, Canada. Mean sea level based on Great Lakes tidal study.
- ▶ Incorporated over 388,000 miles of leveling and 505,000 permanently monumented benchmarks.

NAVD88 VERSUS NGVD29

- ▶ Distortion throughout the United States based on a false assumption.
- ▶ Errors listed in centimeters.
- ▶ 30.48cm = 1.00 USft
- ▶ 100cm = 3.28 USft

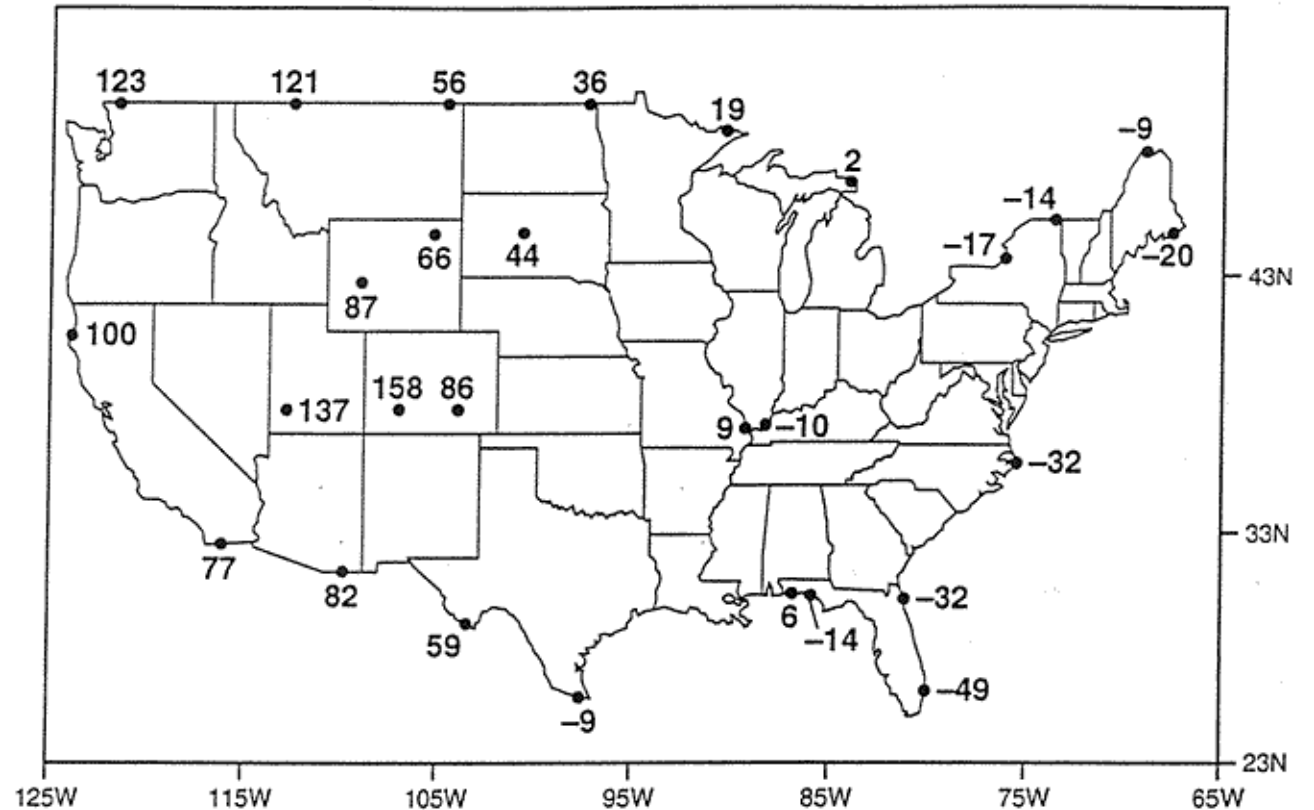

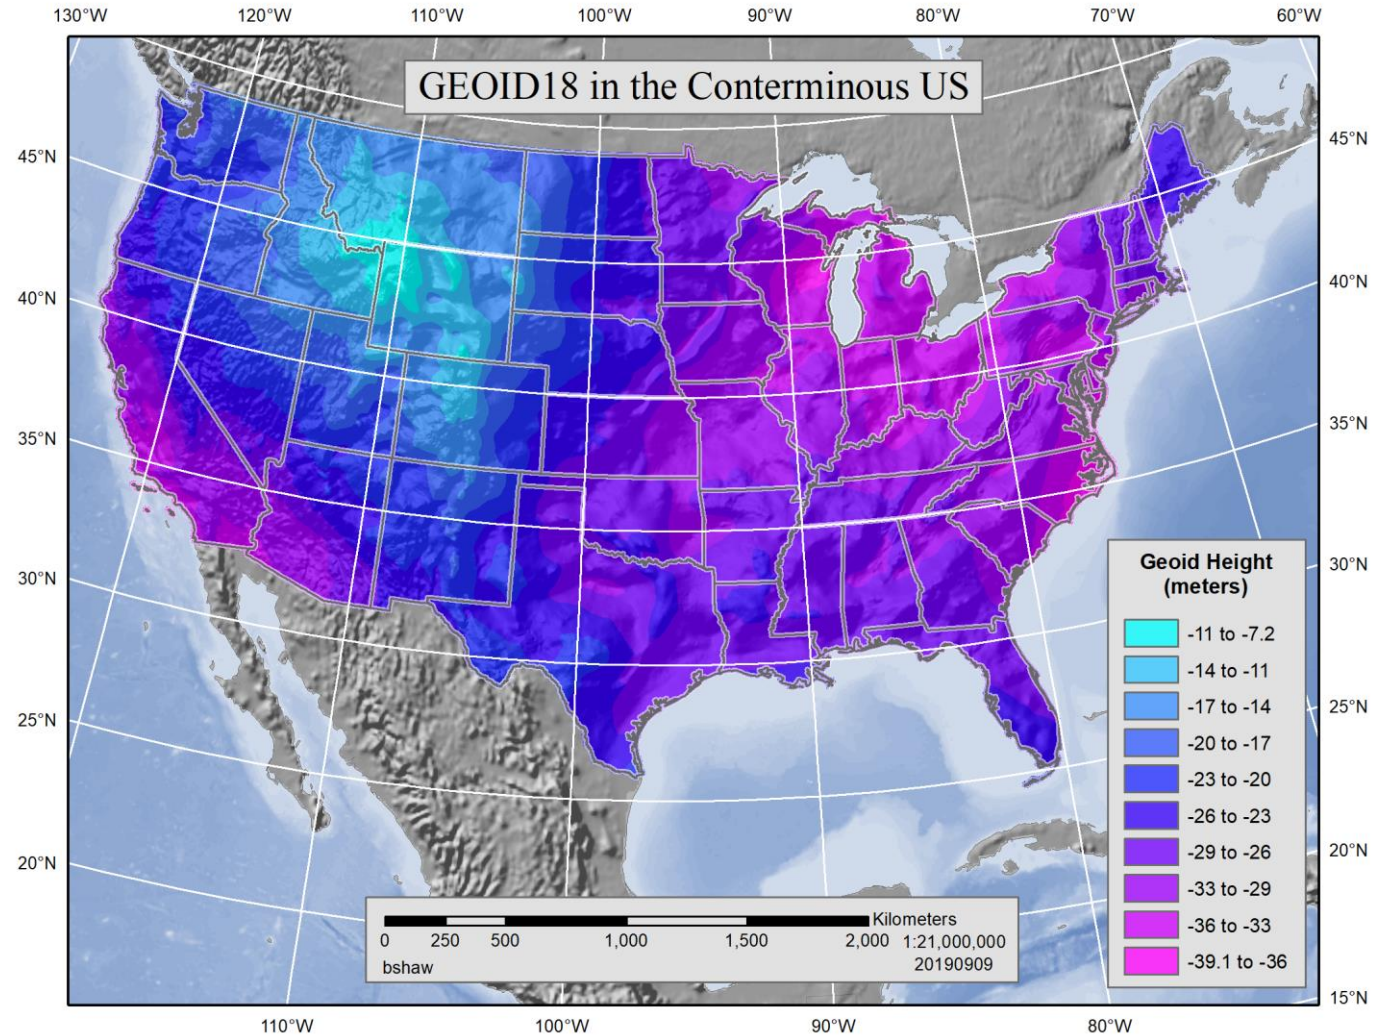

Figure 12. Height differences between NAVD 88 and NGVD 29 in conterminous United States (units = cm).

GEOID18

- ▶ An equipotential surface of the Earth's gravity field which best fits global mean sea level.
- ▶ In Maryland the typical geoid height is -33.0 meters \pm (-108.27 USft \pm)

NAVD88 from GEOID18

- ▶ GPS/GNSS-derived elevations are only an **approximation** of NAVD88.
- ▶ NAVD88 can only be established through differential leveling from established NGS benchmarks.
- ▶ NAGPD2022 will be an equipotential GNSS-based model only.

Planning for Success

What are the project considerations?

- ▶ Horizontal Datum
- ▶ Vertical Datum
- ▶ Accuracy of Locations
- ▶ Deliverables
- ▶ Availability of control
- ▶ Accessibility of control
- ▶ Equipment

Building a Solid Foundation

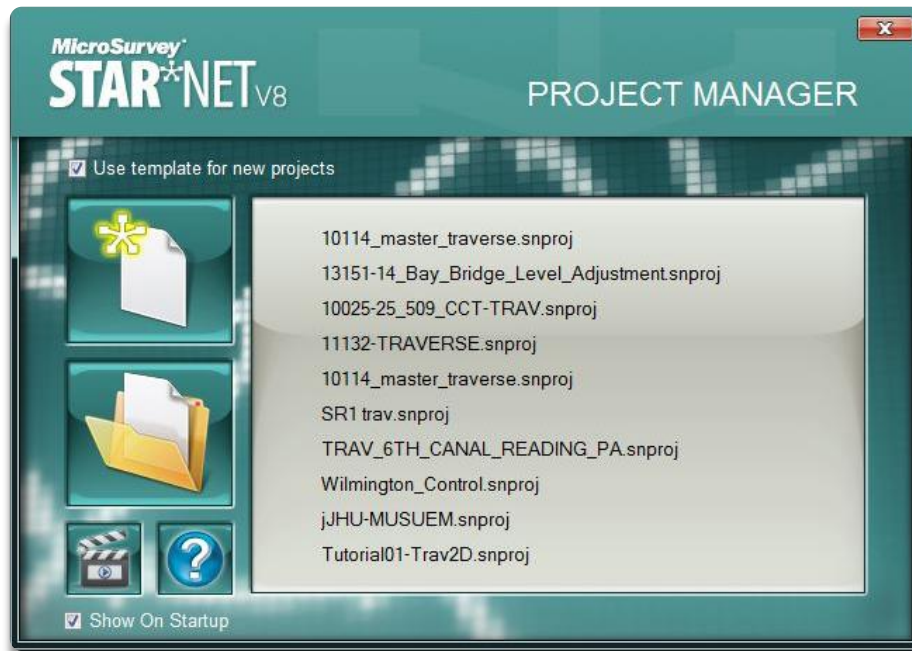

- ▶ Horizontal and vertical datums should be established from known control.
- ▶ Whenever possible, GNSS locations should be repeated with different satellites and should always begin and end on at least two NGS control points.
- ▶ Whenever possible, total station observations should form a loop with at least two known control points.
- ▶ If total station observations do not form a loop, at least two known control points should be used at each end of a linear traverse.
- ▶ Whenever possible, level runs should be a circuit and should include two known benchmarks.

Preparing Star*Net

CONFIGURING THE SETTINGS TO ENSURE OPTIMAL RESULTS

Opening/Starting a Project

- ▶ It is recommended to place Star*Net input and output into its own folder on the disk or network, such as /starnet
- ▶ Before adding data always check the project options.

Options - Adjustment

- ▶ Make sure you understand the data you are adjusting and choose the Adjustment Type and Coordinate System accordingly.

The screenshot shows the 'Project Options' dialog box with the 'Adjustment' tab selected. The 'Adjustment Type' section has three radio buttons: '2D' (unselected), '3D' (selected), and 'Levelling' (unselected). Below '2D' is a text box for 'Average Project Elevation' containing '0.000' and the unit 'FeetUS'. The 'Units' section has a 'Linear' dropdown set to 'FeetUS' and two radio buttons for 'Angular': 'DMS' (selected) and 'GONS' (unselected). The 'Coordinate System' section has a 'Grid' radio button selected, with a dropdown set to 'MD83' and buttons for 'Coordinate System Details' and 'Create Custom System'. Below this is a text box for 'Average Geoid Height' containing '-33.000' and the unit '(Meters)'. The 'Local' radio button is unselected. Under 'Datum Scheme', there are two radio buttons: 'Apply an Average Scale Factor' (selected) with a text box containing '1.0000000000', and 'Reduce to a Common Elevation' (unselected) with a text box containing '0.000' and the unit 'FeetUS'. The 'Geoid/Vertical Deflections' section has two checked checkboxes: 'Using Geoid Modeling' and 'Using Vertical Deflections'. A note at the bottom of this section says 'To change these options please refer to the Modeling Tab'. At the bottom of the dialog are 'OK', 'Cancel', and 'Help' buttons.

The screenshot shows the 'Select Project Coordinate System' dialog box. It has a title bar with a close button. The dialog contains several fields: 'Coordinate System Group' is a dropdown menu set to 'State Planes, NAD83'; 'Coordinate System' is a dropdown menu set to 'MD83'; 'Projection' is a text field containing 'NAD83 Maryland State Plane Zone, Meter'; 'Datum' is a text field containing 'North American Datum of 1983'; and 'Ellipsoid' is a text field containing 'Geodetic Reference System of 1980'. At the bottom are 'OK', 'Cancel', and 'Help' buttons.

Options - General

- ▶ Default values generally used.
- ▶ Middle settings will affect the way data files are read.

Options - Instrument

- ▶ Instrument errors should be set based on a review of manufacturer specifications.
- ▶ Centering errors are an approximation from years of field experience. If these are left at zero the network will be over-constrained.
- ▶ Leveling may be set as an error per distance or as a general error per number of turns between points.

Project Options

Adjustment | General | Instrument | Listing File | Other Files | Special | GPS | Modeling

Conventional

Options – Listing File

- ▶ Highly recommend to always include a copy of the input data so the listing file can be a stand-alone product.
- ▶ Showing coordinate changes from entered provisionals is a great method to tell how well your adjustment is matching a known datum – particularly in a minimally constrained network.
- ▶ Sorting by standard residual helps you to identify errors more quickly.

Options – Other Files

- ▶ The PTS file should be created for importing into CAD/COGO/GIS.
- ▶ The GND file is optional, but recommended. In areas of high grid-to-ground distortion the GND is mandatory.

The screenshot shows the 'Project Options' dialog box with the 'Other Files' tab selected. The dialog has a title bar with 'Project Options' and a close button. Below the title bar is a tabbed interface with tabs for 'Adjustment', 'General', 'Instrument', 'Listing File', 'Other Files', 'Special', 'GPS', and 'Modeling'. The 'Other Files' tab is active and contains the following options:

- Create Coordinate (PTS) File
Format:
- Create Ground Scale Coordinate (GND) File
Format:
- Create Geodetic Position (POS) File
- Default Precisions
Coordinates: Geodetic Positions: Elevations:
- Create Station Information Dump (DMP) File
 Include Relative Connection Covariances

At the bottom of the dialog are three buttons: 'OK', 'Cancel', and 'Help'.

Options – Ground File Settings

- ▶ It is recommended to always let Star*Net determine a computed average scale factor. This average factor will be listed in the GND file.
- ▶ It is recommended that when trying to match ground data to grid data that a central station be held to given coordinates if available, or adjusted coordinates if no known points are centrally located.
- ▶ **WARNING!!!** Always be sure to fully understand the impact of the grid-to-ground factor before using these settings.

Options - Special

- ▶ COMAR and the 2011 ALTA Standards both establish a standard positional tolerance of 0.07 USft + 50ppm. It is recommended to leave this option on for all adjustments.
- ▶ Any redundant measurements to sideshots should be treated as multi-observation network points.

The screenshot shows the 'Project Options' dialog box with the 'Special' tab selected. The 'Positional Tolerance Checking' section is active, showing a checked box for 'Perform Check on Specified Connections'. The tolerance is set to 0.07000 FeetUS and 50.000 PPM, with a confidence of 95.000%. The 'List' section has 'Tolerance Failures Only' selected. The 'Check Sideshots' section has 'Issue Warning Message' selected for both 'For Network Matches' and 'For Repeated SS Names'. The 'Level Loop Check' section has 'Perform tolerance check on level loops' unchecked, with 'Standard' set to 'NGS' and 'Tolerance' set to 'Second Order Class II' at 0.035 ft-√M.

Instrument Specification Sheets

- ▶ Technical specifications are vital to good adjustments!
- ▶ These are the specifications for the Leica GS12.

Technical Specifications

GNSS Technology 	Advanced Measurement Engine	
	Leica patented SmartTrack technology	<ul style="list-style-type: none"> • Jamming resistant measurements • High precision pulse aperture multipath correlator • Excellent low elevation tracking technology • Very low noise GNSS carrier phase measurements with <0.5 mm precision • Minimum acquisition time
	No. of channels	120 channels
	Max. simultaneous tracked satellites	Up to 60 Satellites simultaneously on two frequencies
	Reacquisition time	< 1 sec
	Position latency	Typically 0.02 sec
	GNSS Measurements	
	Satellite signals tracking	GPS: L1, L2, L2C, L5 (C/A, P, C Code) GLONASS: L1, L2 (C/A, P narrow Code); Galileo: E1, E5a, E5b, Alt-BOC; SBAS: WAAS, EGNOS, GAGAN, MSAS
	Measurement Performance	
	Accuracy (rms)¹	
DGPS/RTCM	Typically 25 cm	
Single baseline (< 30 km)	Horizontal: 8 mm + 1 ppm Vertical: 15 mm + 1 ppm	
Network RTK	Horizontal: 8 mm + 0.5 ppm Vertical: 15 mm + 0.5 ppm	
Post processing (phase) Static with long observations	Horizontal: 3 mm + 0.1 ppm Vertical: 3.5 mm + 0.4 ppm	
Post processing (phase) Rapid static mode	Horizontal: 3 mm + 0.5 ppm Vertical: 5 mm + 0.5 ppm	
On-The-Fly Initialization		
Reliability ¹	Better than 99,99% using Leica SmartCheck technology	
Time for initialization	Typically 4 sec ²	
RTK baseline range	up to 70 km	
Data Recording		
Recording rate	Up to 20 Hz	
Hardware		
User Interface		

Sidenote: Distance between RTN GNSS Points

- ▶ Calculations assume the Leica GS12 and the Leica SmartNet RTN
- ▶ From SmartNet: “Assuming the standard GPS RTK protocols and best practice methods are employed for maximum precision i.e. good satellite coverage, good geometry of precisions, low multipath environments etc, SmartNet typically achieves an RTK RMS accuracy of 1-2 cm plan and 2-3 cm height, in areas of SmartNet network correction coverage.”
- ▶ $2 \text{ observed points} = (2\text{cm network error} + 0.8\text{cm instrument error} + 0.15\text{cm centering error}) * 2$
points = 5.90cm or 0.193 USft of potential normal error
- ▶ $0.193 - 0.07 = 0.123 \div 50\text{ppm} = 0.123 \div 0.00005 = 2,460$ USft minimal distance between RTN control points

GPS/GNSS Import

▶ GNSS data will never be hand entered, but will always be the result of a translation.

▶ Be sure to review the G1 line of the resulting DAT file for common points and misnamed points.

▶ NOTE: Pay attention to imported coordinates within the resulting DAT file.

The screenshot shows the STAR*LEICA DBX software interface. The window title is "STAR*LEICA DBX". The interface includes the following fields and options:

- Input DBX Project:** A text field with a "Browse" button to its right.
- Output Data File:** A text field with a left arrow button and a "Browse" button to its right.
- Jobs:** A large empty rectangular box.
- Geoid Path:** A text field containing "P:\standards\ROW\RKK\RKK-Survey\Leica-Geoids" with a "Browse" button to its right.
- CSCS Path:** A text field with a "Browse" button to its right.
- Unit Settings:**
 - Units:** A dropdown menu set to "USFoot".
 - Precision:** A text input field containing "6".
 - Angular:** A dropdown menu set to "DMS".
 - Precision:** A text input field containing "2".
- Data Source Options:**
 - Survey
 - Traverse
 - Sets of Angles
 - Stakeout
 - User Entry
 - Average Shots in Sets
 - Include All Shots in Sets
 - GPS Coordinates
 - GPS Vectors
- Data Format Options:**
 - Change Dash Characters in Station Names to: **Underline** (dropdown)
 - Change Station Name Separator Character to: **Colon** (dropdown)

At the bottom of the window, there are five buttons: "Import !", "View Data File", "Set Viewer", "Help", and "Close".

Total Station Observations for Traverse

- ▶ M code for measurements:
 - ▶ M [AT-FROM-TO] [ANGLE] [DIST] [ZENITH] [HI/HT] [DESCRIPTION]
 - ▶ M TR2-TR1-TR3 65-30-15.25 250.75 89-45-30 5.25/5.10 'IP
- ▶ DV code for distance and vertical measurements:
 - ▶ DV [AT-TO] [DISTANCE] [ZENITH] [HI/HT] [DESCRIPTION]
 - ▶ DV TR2-TR3 250.75 89-45-30 5.25/5.10 'IP
- ▶ .3R code will reduce a 3D measurement to a 2D observation; eliminate HI/HT

Level Runs

- ▶ Typically hand-entered data, therefore the most common source of error.
- ▶ Error weighting based on distance or number of turns
- ▶ L code for differential level observations
- ▶ L [AT-TO] [ELEV DIFF] [DIST or TURNS] [DESCRIPTION]
- ▶ L JV0578-TR1 -4.25 2 'TR

Other Total Station Observations

- ▶ SS code for sideshots:
- ▶ SS [AT-FROM-TO] [ANGLE] [DIST] [ZENITH] [HI/HT] [DESCRIPTION]
- ▶ SS TR2-TR1-5001 65-30-15.25 250.75 89-45-30 5.25/5.10 'IP
- ▶ SS targets can only have one measurement line. If there is more than one measurement of any type, change the SS to an M.

- ▶ T codes stand for Traverse. This can provide a traverse closure report, but makes troubleshooting more difficult. In the Positional Tolerance age, a traverse closure is unnecessary and largely meaningless. Avoid using the T code unless absolutely required.

Reviewing Star*Net

DECIPHERING THE LISTING FILE

Adjustment Statistical Summary

- ▶ The Error Factor ranges should be between 0.5 and 1.5
- ▶ The larger Error Factor is almost always an indicator as to where the data may have a blunder or be of poor quality.
- ▶ Large errors may also indicate unrealistically small standard errors. Be sure your settings are realistic.
- ▶ See “Troubleshooting” until the Error Factors are acceptable.

Solution Has Converged in 5 Iterations

Statistical Summary

Observation	Count	Error Factor
Angles	122	0.574
Distances	451	0.475
Zeniths	234	0.932
Level Data	50	0.547
GPS Deltas	480	1.387
Total	1337	0.980

Chi-Square Test at 5.00% Level Passed

Lower/Upper Bounds (0.952/1.048)

Performing Error Propagation ...

Writing Output Files ...

Network Processing Completed

Elapsed Time = 00:00:04

Chi-Square Test

- ▶ Essentially a test to determine if the resulting residuals are due to random errors.
- ▶ If the test fails, the errors are likely systematic errors, blunders, or incorrect standard errors.
- ▶ Exceeding the upper bound indicates excessive residuals and/or may be the result of too small of standard errors. THIS MUST ALWAYS BE FIXED!
- ▶ Exceeding the lower bounds should be evaluated, but is not a cause for concern.

Level Data	50	0.547
GPS Deltas	480	1.387
Total	1337	0.980

Chi-Square Test at 5.00% Level Passed
Lower/Upper Bounds (0.952/1.048)

Positional Tolerance

- ▶ After satisfied with Error Factor in the Adjusted Statistical Summary, move to the end of the Listing File to review the Positional Tolerance.
- ▶ Stations that fail the Positional Tolerance test will have an asterisk next to them.
- ▶ Evaluate if these stations have redundancy and if the error is acceptable.
- ▶ Keep in mind that the positional tolerance should be met for ALTA surveys and boundary surveys.

Positional Tolerance Check (FeetUS)
Allowable Tolerance = 0.0700 + 50 PPM
Tolerance Check Confidence Region = 95%

Coordinate Standard Deviations

- ▶ Shows the amount of coordinate uncertainty at 67% confidence (one-sigma)
- ▶ Fixed stations will be shown with zero deviation.
- ▶ High deviations indicate areas that may have errors, weak observations, or may require greater redundancy.

Station Coordinate Standard Deviations (FeetUS)

Station Coordinate Error Ellipses

- ▶ Similar to the coordinate standard deviations, but with the additional information indicating the direction of the potential error.
- ▶ The confidence level may be set, but 95% confidence (two-sigma) is typical.
- ▶ If the adjustment fails the Chi-Square test, the deviations are multiplied by the Total Error Factor.

Troubleshooting Star*Net

COMMON ERRORS, COMMON SOLUTIONS

Fast Troubleshooting

- ▶ Be sure sorting by Std Residual was set in the listing files options.
- ▶ Review which data type had the highest Error Factor.
- ▶ Navigate to the Adjusted Observations and Residuals for target data type.
- ▶ Examine the highest errors against the input data for blunders or inconsistent data.
- ▶ Rerun adjustment after each fix and target the next highest error.

Adjusted Zenith Observations (DMS)

Hand Entered Data

- ▶ Often errors are a result of mis-entered information.
- ▶ Be sure to carefully review input data that is causing large errors against the original notes.
- ▶ If the notes match, see if there is sufficient data to make sure there was not an error in the hand-written notes.

Point Names/Numbers

- ▶ Star*Net allows for alpha-numeric naming/numbering.
- ▶ Make sure all unique points have unique names.
- ▶ Make sure all redundant points use identical names.
- ▶ Be sure to always thoroughly review the network plot for points sharing a common position.

Temporary Placeholders

- ▶ Sometimes errors occur because there is not enough data for Star*Net to accurately determine where a point should be.
- ▶ In these instances, create a temporary coordinate close to the points location, but leave all elements open for adjustment.
- ▶ Be sure to clearly denote the file with comments that these points are only to assist with Star*Net processing.

Problems with Zenith Angles

- ▶ Review errors to see if a bad HI/HT is responsible.
- ▶ If HI/HT appears to be good or is unknown, the angle and distance measurements can still be used.
- ▶ Set 3D Reduce mode with the .3R inline command.
- ▶ Comment out the HI/HT
- ▶ Be sure to set .3D after the line in question.

```

Notations for Bad Data

- ▶ Some data simply is bad or incorrect.
- ▶ Use # at the beginning of lines to be ignored, but do not delete the data.
- ▶ Add additional comment lines to explain why the data is being ignored, i.e.:
 - ▶ # Bad/unknown rod height.
 - ▶ # Misnamed point. Actual point unknown.
 - ▶ # High residual errors.

```

Final Notes

PARTING THOUGHTS

Direct Measurements

- ▶ Direct measurements between two points are preferable to indirect measurements.
- ▶ It is encouraged to use boundary evidence with a defined point for survey control.
- ▶ Using boundary evidence has two primary benefits:
 - ▶ It provides direct measurements on the evidence when evaluating the positional tolerance.
 - ▶ It reduces the monuments in the ground that might cause confusion for future surveyors.

Future Adjustments of Already Used Control

- ▶ The purpose of using Star*Net is to get close to the truth through the elimination/proper distribution of sources of error.
- ▶ More data should mean a closer answer to truth.
- ▶ Remember: Truth will never actually be known.
- ▶ Minor variations, $0.03' \pm$, are not a matter of concern.
- ▶ Large variations should be discussed and their cause and merit fully understood before becoming set on the idea of ignoring new input.
- ▶ ***An inconvenient truth is never an excuse for poor procedures!***

Conclusion

REMEMBER THAT STAR*NET HAS A VERY EXTENSIVE
REFERENCE MANUAL.
