Chapter 16

Electric Charge and Electric Field

Contents of Chapter 16

- Static Electricity; Electric Charge and Its Conservation
- Electric Charge in the Atom
- Insulators and Conductors
- Induced Charge; the Electroscope
- Coulomb's Law
- Solving Problems Involving Coulomb's Law and Vectors
- The Electric Field

Contents of Chapter 16

- Electric Field Lines
- Electric Fields and Conductors
- Electric Forces in Molecular Biology: DNA Structure and Replication
- Photocopy Machines and Computer Printers Use Electrostatics
- Gauss's Law

16-1 Static Electricity; Electric Charge and Its Conservation

Objects can be charged by rubbing

(a)

(b)

16-1 Static Electricity; Electric Charge and Its Conservation

(a) Two charged plastic rulers repel

(b) Two charged glass rods repel

(c) Charged glass rod attracts charged plastic ruler

Charge comes in two types, positive and negative; like charges repel and opposite charges attract

16-1 Static Electricity; Electric Charge and Its Conservation

Electric charge is conserved—the arithmetic sum of the total charge cannot change in any interaction.

16-2 Electric Charge in the Atom

Atom:

Nucleus (small, massive,
positive charge)

Electron cloud (large, very
low density, negative
charge)

16-2 Electric Charge in the Atom

Atom is electrically neutral.

Rubbing charges objects by moving electrons from one to the other.

16-2 Electric Charge in the Atom

Polar molecule: neutral overall, but charge not evenly distributed

16-3 Insulators and Conductors

Conductor:

Charge flows freely

Metals

Insulator:

Almost no charge flows

Most other materials

Some materials are semiconductors.

Charged Neutral

(a)

(b)

(c)

16-4 Induced Charge; the Electroscope

Metal objects can be charged by conduction:

16-4 Induced Charge; the Electroscope

They can also be charged by induction:

16-4 Induced Charge; the Electroscope

Nonconductors won't become charged by conduction or induction, but will experience charge separation:

16-4 Induced Charge; the Electroscope

The electroscope can be used for detecting charge:

16-4 Induced Charge; the Electroscope

The electroscope can be charged either by conduction or by induction.

16-4 Induced Charge; the Electroscope

The charged electroscope can then be used to determine the sign of an unknown charge.

16-5 Coulomb's Law

Experiment shows that the electric force between two charges is proportional to the product of the charges and inversely proportional to the distance between them.

16-5 Coulomb's Law

Coulomb's law:

$$F = k \frac{Q_1 Q_2}{r^2},$$

[magnitudes] (16-1)

This equation gives the magnitude of the force.

16-5 Coulomb's Law

The force is along the line connecting the charges, and is attractive if the charges are opposite, and repulsive if they are the same.

F_{12} = force on 1
due to 2

(a)

F_{21} = force on 2
due to 1

(b)

(c)

16-5 Coulomb's Law

Unit of charge: coulomb, C

The proportionality constant in Coulomb's law is then:

$$k = 8.988 \times 10^9 \text{ N}\cdot\text{m}^2/\text{C}^2$$

Charges produced by rubbing are typically around a microcoulomb:

$$1 \mu\text{C} = 10^{-6} \text{ C}$$

16-5 Coulomb's Law

Charge on the electron:

$$e = 1.602 \times 10^{-19} \text{ C}$$

Electric charge is quantized in units of the electron charge.

16-5 Coulomb's Law

The proportionality constant k can also be written in terms of ϵ_0 , the permittivity of free space:

$$F = \frac{1}{4\pi\epsilon_0} \frac{Q_1 Q_2}{r^2}, \quad (16-2)$$

$$\epsilon_0 = \frac{1}{4\pi k} = 8.85 \times 10^{-12} \text{ C}^2/\text{N} \cdot \text{m}^2.$$

16-5 Coulomb's Law

Coulomb's law strictly applies only to point charges.

Superposition: for multiple point charges, the forces on each charge from every other charge can be calculated and then added as vectors.

16-6 Solving Problems Involving Coulomb's Law and Vectors

The net force on a charge is the vector sum of all the forces acting on it.

$$\vec{\mathbf{F}}_{\text{net}} = \vec{\mathbf{F}}_1 + \vec{\mathbf{F}}_2 + \cdots.$$

16-6 Solving Problems Involving Coulomb's Law and Vectors

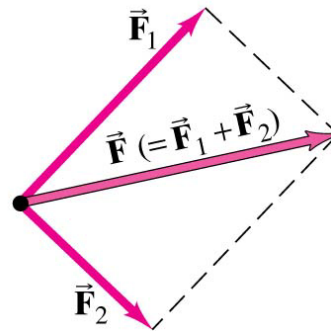

Vector addition review:

(a) Two forces acting on an object.

(b) The total, or net, force is $\vec{F} = \vec{F}_1 + \vec{F}_2$ by the tail-to-tip method of adding vectors.

(c) $\vec{F} = \vec{F}_1 + \vec{F}_2$ by the parallelogram method.

(d) \vec{F}_1 and \vec{F}_2 resolved into their x and y components.

16-7 The Electric Field

The electric field is the force on a small charge, divided by the charge:

$$\vec{\mathbf{E}} = \frac{\vec{\mathbf{F}}}{q}. \quad (16-3)$$

16-7 The Electric Field

For a point charge:

$$E = \frac{F}{q} = \frac{kqQ/r^2}{q}$$

$$E = k \frac{Q}{r^2}; \quad [\text{single point charge}] \quad (16-4a)$$

$$E = \frac{1}{4\pi\epsilon_0} \frac{Q}{r^2}. \quad [\text{single point charge}] \quad (16-4b)$$

16-7 The Electric Field

Force on a point charge in an electric field:

$$\vec{\mathbf{F}} = q\vec{\mathbf{E}}. \quad (16-5)$$

Superposition principle for electric fields:

$$\vec{\mathbf{E}} = \vec{\mathbf{E}}_1 + \vec{\mathbf{E}}_2 + \cdots.$$

16-7 The Electric Field

Problem solving in electrostatics: electric forces and electric fields

1. Draw a diagram; show all charges, with signs, and electric fields and forces with directions
2. Calculate forces using Coulomb's law
3. Add forces vectorially to get result

16-8 Electric Field Lines

The electric field can be represented by field lines. These lines start on a positive charge and end on a negative charge.

(a)

(b)

16-8 Electric Field Lines

The number of field lines starting (ending) on a positive (negative) charge is proportional to the magnitude of the charge.

The electric field is stronger where the field lines are closer together.

16-8 Electric Field Lines

Electric dipole: two equal charges, opposite in sign:

16-8 Electric Field Lines

(d)

The electric field between two closely spaced, oppositely charged parallel plates is constant.

16-8 Electric Field Lines

Summary of field lines:

1. Field lines indicate the direction of the field; the field is tangent to the line.
2. The magnitude of the field is proportional to the density of the lines.
3. Field lines start on positive charges and end on negative charges; the number is proportional to the magnitude of the charge.

16-9 Electric Fields and Conductors

The static electric field inside a conductor is zero—if it were not, the charges would move.

The net charge on a conductor is on its surface.

16-9 Electric Fields and Conductors

The electric field is perpendicular to the surface of a conductor—again, if it were not, charges would move.

16-10 Electric Forces in Molecular Biology: DNA Structure and Replication

Molecular biology is the study of the structure and functioning of the living cell at the molecular level.

The DNA molecule is a double helix:

16-10 Electric Forces in Molecular Biology: DNA Structure and Replication

The A-T and G-C nucleotide bases attract each other through electrostatic forces.

16-10 Electric Forces in Molecular Biology: DNA Structure and Replication

Replication: DNA is in a “soup” of A, C, G, and T in the cell. During random collisions, A and T will be attracted to each other, as will G and C; other combinations will not.

16-11 Photocopy Machines and Computer Printers Use Electrostatics

Photocopy machine:

- drum is charged positively
- image is focused on drum
- only black areas stay charged and therefore attract toner particles
- image is transferred to paper and sealed by heat

16-11 Photocopy Machines and Computer Printers Use Electrostatics

16-11 Photocopy Machines and Computer Printers Use Electrostatics

Laser printer is similar, except a computer controls the laser intensity to form the image on the drum

16-12 Gauss's Law

Electric flux:

$$\Phi_E = E_{\perp} A = EA_{\perp} = EA \cos \theta, \quad (16-7)$$

Electric flux through an area is proportional to the total number of field lines crossing the area.

16-12 Gauss's Law

Flux through a closed surface:

$$\begin{aligned}\Phi_E &= E_1 \Delta A_1 \cos \theta_1 + E_2 \Delta A_2 \cos \theta_2 + \dots \\ &= \sum E \Delta A \cos \theta = \sum E_{\perp} \Delta A,\end{aligned}$$

16-12 Gauss's Law

The net number of field lines through the surface is proportional to the charge enclosed, and also to the flux, giving Gauss's law:

$$\sum_{\text{closed surface}} E_{\perp} \Delta A = \frac{Q_{\text{encl}}}{\epsilon_0}, \quad (16-9)$$

This can be used to find the electric field in situations with a high degree of symmetry.

Summary of Chapter 16

- Two kinds of electric charge—positive and negative
- Charge is conserved
- Charge on electron: $e = 1.602 \times 10^{-19} \text{ C}$
- Conductors: electrons free to move
- Insulators: nonconductors

Summary of Chapter 16

- Charge is quantized in units of e
- Objects can be charged by conduction or induction
- Coulomb's law:

$$F = k \frac{Q_1 Q_2}{r^2}, \quad [\text{magnitudes}] \quad (16-1)$$

- Electric field is force per unit charge:

$$\vec{\mathbf{E}} = \frac{\vec{\mathbf{F}}}{q} \quad (16-3)$$

Summary of Chapter 16

- Electric field of a point charge:

$$E = \frac{F}{q} = \frac{kqQ/r^2}{q}$$

$$E = k \frac{Q}{r^2}; \quad \text{[single point charge]} \quad (16-4a)$$

- Electric field can be represented by electric field lines
- Static electric field inside conductor is zero; surface field is perpendicular to surface

- Electric flux: $\Phi_E = E_{\perp} A = EA_{\perp} = EA \cos \theta, \quad (16-7)$

- Gauss's law: $\sum_{\text{closed surface}} E_{\perp} \Delta A = \frac{Q_{\text{encl}}}{\epsilon_0}, \quad (16-9)$
