

Create Tag Descriptions Automatically with
User-Defined Data Types

**Document a Logix5000
project in significantly less
time by using user-defined
data types combined with the
pass-through of descriptions.**

Automate Tag Descriptions Using User-Defined Data Types

Tag-Based Memory Makes Projects Self-Documenting

The Allen Bradley Logix5000™ controller's tag-based memory provides an evolution in the development of the Programmable Logic Controller (PLC). The use of appropriately named variables rather than cryptic physical addresses makes application programs self-documenting and thus easier to create and maintain.

- RSLogix™ 5000 software, the programming software for the Logix5000 controllers, lets you create up to a 40-character name for each variable (tag). This lets the tag's name be fairly descriptive of how the tag is used in the application.
- User-defined data types (structures) let you create customized memory records that consolidate multiple fields (members) of data into a single contiguous group with a hierarchical lay-out.

Descriptions Clarify Tag Names

Even with these premier capabilities, the purpose of a tag can still be ambiguous. By adding a description to a tag, RSLogix 5000 software lets you add another 120 characters of information.

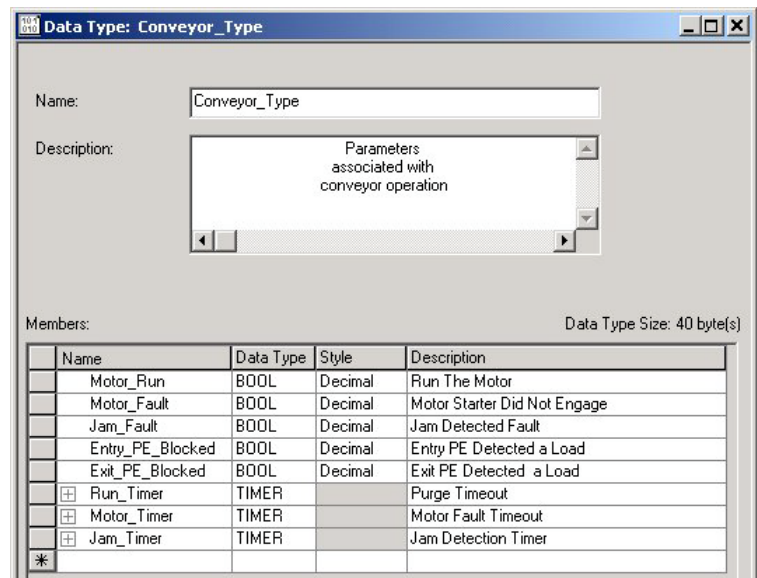

- Because you have to manually enter descriptions, they are often left blank. This can lead to additional expense during startup or when maintaining the system.
- Starting with version 13, RSLogix 5000 software automates the creation of tag descriptions, thus improving the application while minimizing the associated development cost.

Structures Include a Description of Each Member

RSLogix 5000 software, like most programming software, lets you assign both a name and description for each member within a user-defined data type.

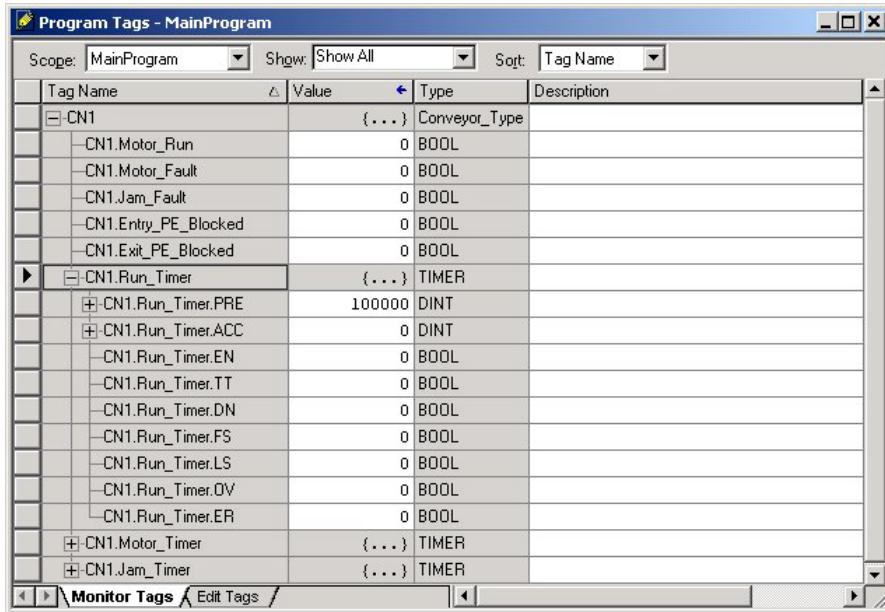

Member name - The program uses the member name to access the associated data.

Member description - The description helps to define the purpose of the member.

Automate Tag Descriptions Using User-Defined Data Types

With other development software, you see the description for a member only if you look at the definition of the user-defined data type; the descriptions don't carry through to any tags that are based on the user-defined data type.

The screenshot shows a window titled "Program Tags - MainProgram" with a table of tag members. The table has columns for Tag Name, Value, Type, and Description. The tags are organized into a tree structure under "CN1".

Tag Name	Value	Type	Description
[-] CN1	{...}	Conveyor_Type	
[-] CN1.Motor_Run	0	BOOL	
[-] CN1.Motor_Fault	0	BOOL	
[-] CN1.Jam_Fault	0	BOOL	
[-] CN1.Entry_PE_Blocked	0	BOOL	
[-] CN1.Exit_PE_Blocked	0	BOOL	
[+] CN1.Run_Timer	{...}	TIMER	
[+] CN1.Run_Timer.PRE	100000	DINT	
[+] CN1.Run_Timer.ACC	0	DINT	
[-] CN1.Run_Timer.EN	0	BOOL	
[-] CN1.Run_Timer.TT	0	BOOL	
[-] CN1.Run_Timer.DN	0	BOOL	
[-] CN1.Run_Timer.FS	0	BOOL	
[-] CN1.Run_Timer.LS	0	BOOL	
[-] CN1.Run_Timer.OV	0	BOOL	
[-] CN1.Run_Timer.ER	0	BOOL	
[+] CN1.Motor_Timer	{...}	TIMER	
[+] CN1.Jam_Timer	{...}	TIMER	

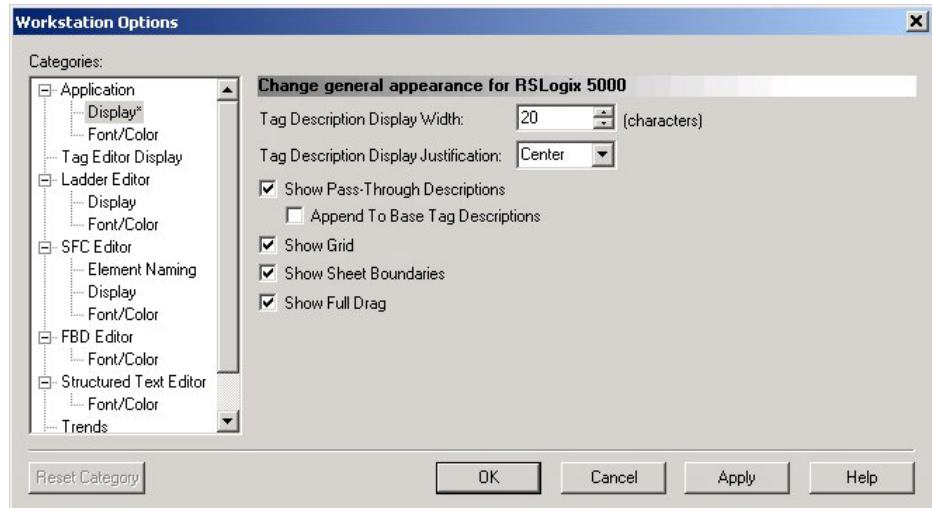

To get specific documentation for a tag, each of its members requires its own description.

In most cases, the descriptions you enter for a tag's members are based on the descriptions that you already entered in the user-defined data type. This means that each time you create a tag that uses the user-defined data type, you must manually enter an almost identical description for each member of the tag.

Automate Tag Descriptions Using User-Defined Data Types

RSLogix 5000 Software Reduces the Documentation Time

RSLogix 5000 software now differs from other software in the industry because it lets you reuse documentation work you have already done. The new *Show Pass-Through Descriptions* feature dramatically reduces your documentation and development time while improving your documentation.

When turned on, the *Show Pass-Through Descriptions* feature lets RSLogix 5000 software look within a tag and/or its associated user-defined data type for an available description.

- The software looks for the description that most likely is the best fit for the tag member.
- Depending on how the tag is defined, the software pulls the description from the root portion of the tag or from the appropriate member of its user-defined data type.
- Once found, the software automatically shows the description in the tag window and the logic (i.e., the description passes through to the tag).

Automate Tag Descriptions Using User-Defined Data Types

In the following example, the descriptions for the Conveyor_Type data type (shown earlier) and each of its members pass through to a tag that uses that data type. Both the tag monitor window and the logic editor show the pass-through descriptions.

The screenshot displays a PLC software interface with two main windows:

- MainProgram - MainRoutine:** Shows a logic editor with a ladder logic network. It includes a 'Jam Detection Timer' block (TON) and a 'Conveyor CN1 Motor Starter Output' block. The timer block has inputs for 'Timer On Delay' (CN1.Jam_Timer), 'Timer' (CN1.Jam_Timer), 'Preset' (5000), and 'Accum' (0). The output is 'Jam Detected Fault' (CN1.Jam_Fault). The motor starter output block has an input for 'Jam Detected Fault' (CN1.Jam_Fault) and an output for 'Conveyor CN1 Motor Starter Output' (CN1_M). The motor starter output is connected to a coil labeled '<Local:2:O Data.0>'. The logic editor also shows 'Conveyor CN1 Entry' and 'Photo Eye Input' (CN1_PE1) connected to '<Local:1:I Data.2>'.
- Program Tags - MainProgram:** Shows a table of tags with their names, values, types, and descriptions.

Tag Name	Value	Type	Description
[-] CN1	{...}	Conveyor_Type	Parameters associated with conveyor operation
[-] CN1.Motor_Run	0	BOOL	Run The Motor
[-] CN1.Motor_Fault	0	BOOL	Motor Starter Did Not Engage
[-] CN1.Jam_Fault	0	BOOL	Jam Detected Fault
[-] CN1.Entry_PE_Blocked	0	BOOL	Entry PE Detected a Load
[-] CN1.Exit_PE_Blocked	0	BOOL	Exit PE Detected a Load
[-] CN1.Run_Timer	{...}	TIMER	Purge Timeout
[-] CN1.Run_Timer.PRE	100000	DINT	Purge Timeout
[-] CN1.Run_Timer.ACC	0	DINT	Purge Timeout
[-] CN1.Run_Timer.EN	0	BOOL	Purge Timeout
[-] CN1.Run_Timer.TT	0	BOOL	Purge Timeout
[-] CN1.Run_Timer.DN	0	BOOL	Purge Timeout
[-] CN1.Run_Timer.FS	0	BOOL	Purge Timeout
[-] CN1.Run_Timer.LS	0	BOOL	Purge Timeout
[-] CN1.Run_Timer.OV	0	BOOL	Purge Timeout
[-] CN1.Run_Timer.ER	0	BOOL	Purge Timeout
[-] CN1.Motor_Timer	{...}	TIMER	Motor Fault Timeout
[-] CN1.Jam_Timer	{...}	TIMER	Jam Detection Timer

Automate Tag Descriptions Using User-Defined Data Types

Pass-Through Descriptions Are Specific to Each Tag

If your application uses the same user-defined data type for many tags, the benefits are even more substantial.

- When multiple tags use the same user-defined data type, pass-through of descriptions is a great help. However, the descriptions may still be too general and lack meaningful documentation about the tag itself.
- To help in this area, RSLogix 5000 software offers an additional feature called *Append to Base Tag Description*. It concatenates the description of the user-defined data type member to the description from the base tag. This creates specific descriptions for each member of a tag that uses a user-defined data type.

In the following example, the software automatically builds a description for each member of the CN1 tag. It starts with the description for the base tag (Conveyor CN1) and then adds the description for the members from the user-defined data type.

The screenshot displays the RSLogix 5000 software interface. The top window, titled 'MainProgram - MainRoutine', shows a ladder logic diagram. A coil is connected to a normally open contact labeled 'CN1'. The diagram also includes a 'Timer On Delay' block with 'Timer' set to 'CN1.Jam_Timer', 'Preset' set to '5000', and 'Accum' set to '0'. Below the diagram, there are labels for 'Conveyor CN1 Jam Detection Timer', 'Conveyor CN1 Jam Detected Fault', and 'Conveyor CN1 Jam Detected Fault CN1.Jam_Timer.DN'. The bottom window, titled 'Program Tags - MainProgram', shows a table of tags.

Tag Name	Value	Type	Description
[-] CN1	{...}	Conveyor_Type	Conveyor CN1
[-] CN1.Motor_Run	0	BOOL	Conveyor CN1 Run The Motor
[-] CN1.Motor_Fault	0	BOOL	Conveyor CN1 Motor Starter Did Not Engage
[-] CN1.Jam_Fault	0	BOOL	Conveyor CN1 Jam Detected Fault
[-] CN1.Entry_PE_Blocked	0	BOOL	Conveyor CN1 Entry PE Detected a Load
[-] CN1.Exit_PE_Blocked	0	BOOL	Conveyor CN1 Exit PE Detected a Load
[+] CN1.Run_Timer	{...}	TIMER	Conveyor CN1 Purge Timeout
[+] CN1.Motor_Timer	{...}	TIMER	Conveyor CN1 Motor Fault Timeout
[+] CN1.Jam_Timer	{...}	TIMER	Conveyor CN1 Jam Detection Timer
[+] [-] CN2	{...}	Conveyor_Type	Conveyor CN2
[-] CN2.Motor_Run	0	BOOL	Conveyor CN2 Run The Motor
[-] CN2.Motor_Fault	0	BOOL	Conveyor CN2 Motor Starter Did Not Engage
[-] CN2.Jam_Fault	0	BOOL	Conveyor CN2 Jam Detected Fault
[-] CN2.Entry_PE_Blocked	0	BOOL	Conveyor CN2 Entry PE Detected a Load
[-] CN2.Exit_PE_Blocked	0	BOOL	Conveyor CN2 Exit PE Detected a Load
[+] CN2.Run_Timer	{...}	TIMER	Conveyor CN2 Purge Timeout
[+] CN2.Motor_Timer	{...}	TIMER	Conveyor CN2 Motor Fault Timeout
[+] CN2.Jam_Timer	{...}	TIMER	Conveyor CN2 Jam Detection Timer

Automate Tag Descriptions Using User-Defined Data Types

Pass-Through Descriptions Adjust to the Type of Tag

The source for the pass-through description varies based on the type of tag, element, or member. Essentially, RSLogix 5000 software searches upward through the tag hierarchy for a description that is as close as possible to the item that needs to be documented.

- The search process begins with the user-defined data type, if one is used. If no user-defined data type is present, it steps up a level.
- If you have nested user-defined data types, it moves up to the root of the nested user-defined data type.
- If the element is an array, it pulls the description from the tag that defines the array.

The following table provides a brief overview of the look-up process for a pass-through description.

If the tag or array is:	Then for this:	The software looks for a description in this order:
<i>not</i> based on a user-defined data type	Array	n/a
	element of an array	tag that defines the array
	bit of an element of an array	1. element 2. tag that defines the array
based on a user-defined data type	single tag	user-defined data type
	member of a single tag	1. member in the user-defined data type 2. tag
	Array	user-defined data type
	element of an array	1. user-defined data type 2. tag that defines the array
	member of an element of an array	1. member in the user-defined data type 2. element 3. user-defined data type 4. tag that defines the array

Keep in mind that the software performs additional checks if:

- the member is nested more than one level of a user-defined data type.
- the *Append to Base Tag Description* feature is turned on.

Automate Tag Descriptions Using User-Defined Data Types

The source description that is concatenated via the *Append to Base Description* varies depending on the type of tag.

This tag type:	Uses this base description:
non-array tag elements	description from the base tag
array tag elements	description from the base tag
user-defined data type member of an element of an array	element description, if one is present; otherwise it defaults back to the base tag's description.

Use Pass-Through Descriptions As a Starting Point

RSLogix 5000 software gives you many aids for working with pass-through descriptions:

- To override a pass-through description, simply enter a description for the tag element you want to change.
- The tag window uses different colors for pass-through versus normal descriptions. This helps you see the difference between a description that is being passed through from another source and one that is directly attached to the tag itself.

If you see a description in this color:	Then the description is a:
gray	pass-through description
black	normal (manually-entered) description

- To use a pass-through description as the basis for a normal description, click the right mouse button on the tag and choose *Paste Pass-Through*.
- To quickly determine where to go to change the source of a pass-through description, simply point your mouse to the description. A pop-up tool-tip lists the source of the description.

Automate Tag Descriptions Using User-Defined Data Types

Pass-Through Descriptions Save Hours of Development Time

Pass-through descriptions can bring very substantial development savings. Designs that use user-defined data types see the most significant benefit.

- In the very simple conveyor example shown earlier, there were 8 members in the user-defined data type.
- Each description took about 20 seconds to enter and confirm.
- If you used this user-defined data type for 100 tags, this would amount to about 4 hours and 27 minutes of savings (20 Seconds * 8 Members * 100 tags).

Extending this to a normally sized system might result in user-defined data types with many more members. Additionally, the number of tag instances that could benefit from these user-defined data type descriptions would be substantially larger. As the sizes and quantities increase, so do the savings.

Several systems integrators who reviewed this feature feel it will save them hundreds of hours of development time. Similarly, end users of these systems expect that the improved documentation will reduce startup time, simplify maintenance, and reduce system downtime.
