

M-303

M&J VALVE SLAB GATE VALVE

M&J Valve was founded in 1962 by Marvin Grove and has been a leader in the pipeline valve industry since its inception. Now part of SPX Flow Technology, M&J Valve meets or exceeds the quality standards of our customers and the valve industry. With a product offering of slab and expanding through-conduit gate valves, axial surge valves and rotary control valves, piston, ball, and swing check valves. M&J Valve can provide a wide variety of flow control solutions for liquid, geothermal and gas markets. This combination of products, technical know-how and field experience has allowed for a history of product innovation which has positioned M&J Valve in a leadership position within the valve industry.

Finding innovative ways to help the world meet its ever growing demand for energy is a key focus for SPX. As a multi industry manufacturer, we provide creative solutions that serve global energy markets in a myriad of ways. SPX is helping to meet that demand with a broad range of high quality, custom-engineered systems and components that can also help improve efficiency and reduce the use of natural resources. We also supply a wide range of components — from air preheaters to filter systems. SPX off-the-shelf and customized solutions are supporting all phases of oil, gas and biofuel production, from exploration, extraction and processing to transport and storage.

M-303: The Performance Leader in Thru-Conduit Gate Valves

The M&J Valve Model M-303 is an advanced fabricated body design slab gate valve manufactured and tested to API-6D. The fabricated body allows for a wide selection of material choices. The floating slab gate uses the natural force of line pressure to obtain a dynamically tight downstream seal in high-pressure differential applications. Low-pressure sealing is accomplished with coil springs that energize the seat pushing it against the gate.

Ease of maintenance and versatility make the M-303 the leading gate valve in the industry. The two-piece stem/common yoke simplifies operator mounting and conversions. The two-piece stem design (14" and larger) allows different materials to be used in wetted areas while standard material is used for stem threads. Combined with the bolted packing retainer, the two piece stem allows quick operator and extension changes in the field with the valve under pressure.

CHOICE OF OPERATORS

Manual, electric, hydraulic or cylinder

PATENTED M&J CUPOLA DESIGN-14" AND LARGER

Allows easy removal of stem and top works while valve is in service.

PRIMARY STEM SEALS

Standard stem packing style VIH Packing for long life.

SECONDARY STEM SEAL/PACKING INJECTOR

A backup safety feature using plastic nonflammable stem sealant.

TOP ENTRY

For in-line maintenance.

ADVANCED FABRICATED BODY CONSTRUCTION

Allows choice of body and trim materials, including regular and low temperature designs.

FLOATING SLAB GATE

Utilizing the natural force of line pressure to obtain a dynamically tight down-stream seal in high pressure differential applications.

Typical product applications

SPRING/PRESSURE LOADED SEAT RINGS

With 20# springs and nylon/elastomer seals for a continuous positive seal in low or high pressure differential service.

FULL THRU-CONDUIT PORT

For easy passage of pigs, wipers, and scrapers.

NON-CORROSIVE & CORROSIVE TRIMS

Including NACE for sour crude services.

Oil, Gas, Liquid Products & Secondary Recovery

Mainline Block Valves

Tank and Station Valves

Block & Bleed Valves

Manifold Valves

Launcher/Receiver Trap Valves

Meter Bypass Valves

Emergency Shutdown Valves

Hot Tap Valves

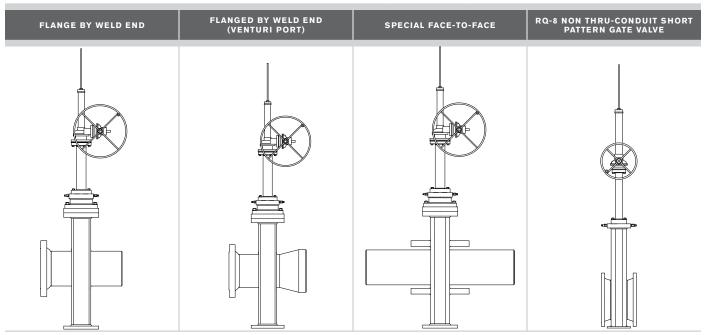

Size and Class

Performance begins with a standard body configuration practical enough for quick assembly line operation.

^{*12&}quot; only without cupola. Flanged ends available on all body configurations.

Flexible enough to handle even the toughest non-standard dimensional and pressure rating specifications.

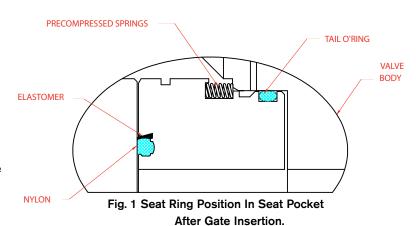

The Heart of the M-303 Thru Conduit Gate Valve Features Strong Coil Springs, Pressure Loaded Seat Rings, and a Floating Slab Gate

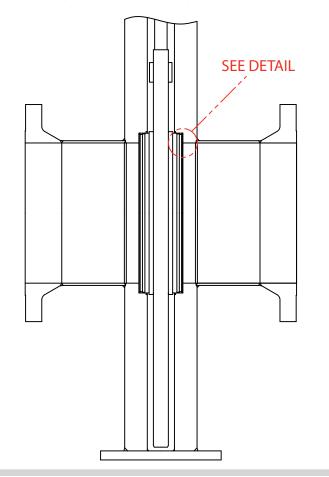

THE STRONG MECHANICAL FORCE OF SPRING PRESSURE STARTS WITH THE PATENTED M&J SEAT RING:

- Closely spaced 20# springs are compressed into a specially tapered groove around the entire perimeter of the seat ring.
- A stainless steel band secures and protects the springs during installation and maintenance operations
- A tail "o" ring seals against fluid and pressure leaking past the seat ring. It also serves as a piston seal allowing the seat ring to become pressure energized.
- A patented nylon/elastomer seal in the same face groove acts as a primary seal in both high and low pressure differential.
- Nylon acts as a high pressure seal and as a resilient load bearing protective surface (preventing metal-to-metal contact) during gate travel.
- Elastomer doubles as a low pressure seal and as a soft wipe to prevent gate scoring by extraneous foreign particles.
- A strong mechanical force, it can maintain a seal while undergoing a sustained 5 psi air seat test.
- A durable mechanical force, it will not lose strength with time

For low pressure and differential service, the M&J seat rings are mechanically energized when the floating slab gate is assembled into the M-303 valve body. As the gate penetrates downward, the seat rings are pushed back into their seat pockets causing the precompressed springs to engage the recessed seat pocket walls. Instantly, a uniform mechanical force is exerted around the entire (360°) sealing surface of the seat rings as they press to the face of the gate.

Note: Spring contact with pocket creating additional spring compression

Performance is the ability of the M-303 to seal upstream and downstream under a low (5 psi) pressure differential test.

IN ANY SIZE-IN ANY CLASS.

YOU CAN CALCULATE IT.

Using a 30" Class 150 M-303:

TOTAL SPRING FORCE BEHIND =
$$\frac{\text{NOMINAL PIPE SIZE}}{\text{SPRING SPACING}} \times \varpi \times \frac{\text{SPRING SPACING}}{\text{FORCE}}$$

$$= \frac{30" \times 3.146}{3/4"} \times 20\#$$

$$= 2,520\#$$

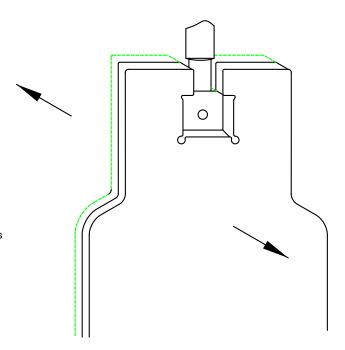

Seat Rings and Gate

The dynamic force of line pressure, harnessed by pressure-loaded seat rings and floating gate is a key feature to the sealing capability of the M-303 gate valve. Unlike trunnion-mounted ball valves, the M-303's floating slab gate is mounted on a T-bar allowing the seat rings and gate to move laterally (1/16") in either direction. Pressure energized, the gate and seat rings move in unison. Like pistons, their load bearing surfaces quickly transmit the full dynamic force of line pressure to sealing areas on both sides of the gate.

An active force, line pressure works on the surface of the seat rings as well as on the flat surface of the floating gate.

A dynamic force, it increases proportionally with line pressure.

A powerful force, it can generate a downstream sealing capability unequalled by trunnion-mounted pipeline ball valves.

Surface Areas and Sealing Force Defined

With the valve in the closed position and the body bleed open, line pressure working on both sides of the M-303 floating slab gate creates two distinct areas of sealing force. The smaller area (UFsr_o and DFsr_o) is located on the back side of each seat ring and is shown by a line from the top of the tail "0" ring to the centerline contact point of the Nylon /Elastomer face seal. This area constitutes the flat surface of a piston -with a hole in it. When line pressure acting upon this surface exceeds those forces already generated by mechanical spring pressure, the seat ring becomes "pressure energized" and presses its sealing surface even harder against the face of the floating slab gate.

A much larger area (UFg and DFg) is shown by the center line to center line contact point of the nylon elastomer seal as it faces the floating slab gate. This area constitutes the surface diameter of the M-303 floating slab gate. Under high differential line pressure, the gate exerts proportionately more force on the downstream seat ring seal.

The amount of sealing force generated by line pressure acting upon the surface of the M-303 seat rings and floating slab gate can be easily computed:

Example: A 30" Class 150 M-303 thru-conduit gate valve

 $S = Outside diameter of the Seal ring 32^1/2"$

G = Diameter of the seat seal against the flat surface of the Mating slab Gate = 30"

LP = Working Pressure

u = Upstream = 275 psi

d = Downstream = 10 psi

Upstream Force- seat ring - body bleed open

UFsr_o =
$$\underline{\pi}$$
 (S²-G²) Pu

Upstream Force-gate

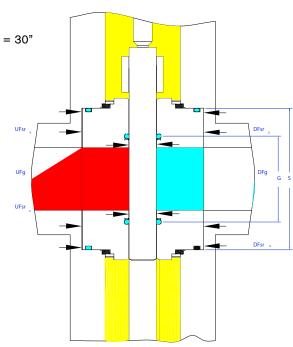

$$UFg = \underline{\pi} (G^2) Pu$$

Downstream Force-seal ring - body bleed open

$$DFsr_0 = \underline{\pi} (S^2-G^2) Pd$$

Downstream Force - gate

$$DFg = \underline{\pi} (G^2) Pd$$

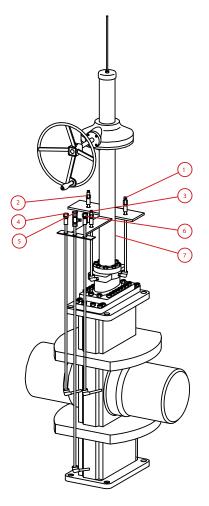

In addition to selecting operator options, M&J customers can request the following accessory items for buried service.

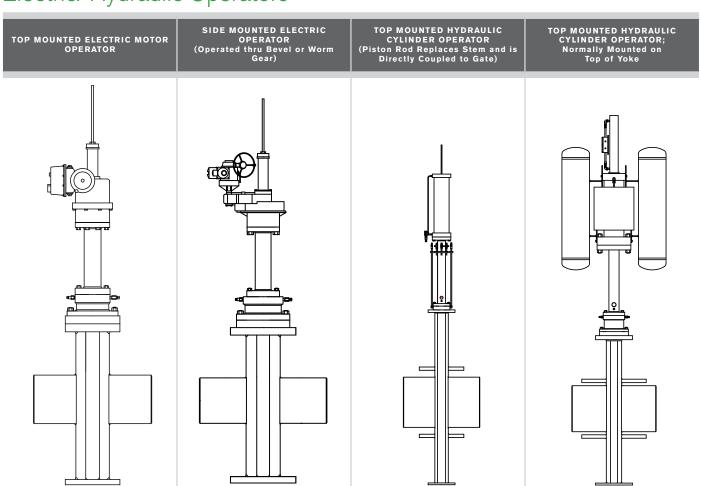

Extended Piping* for

- 1. Stem packing injector
- 2. Body pressure relief valve
- 3. Stem packing release valve
- 4. Secondary grease fitting-upstream seat
- 5. Pipe plug (body drain)
- 6. Secondary grease fitting-downstream seat
- 7. Yoke tube

*Parts are manufactured to customer specification based on the centerline of bore to operator mounting flange.

Electric/Hydraulic Operators

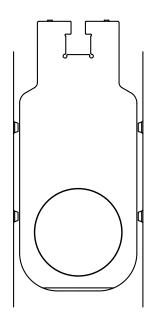

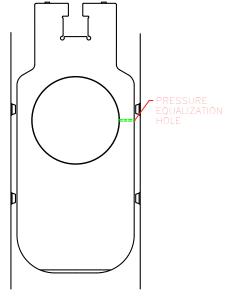

Failclose Valves

M&J reverse acting gate valves vary from our standard gate valve only in that the hole is bored in the opposite end of the gate. This means the gate moves upward to close. M&J reverse acting gate valves are job-matched with safety/fail-close actuators to make a perfect safety valve system.

To open the valve, actuators are powered by line pressure or external hydraulic or pilot air/gas. To close the valve, pilot vents actuator pressure and a coil steel spring moves the gate upward. Line pressure in the valve under the stem assists the upward movement of the gate.

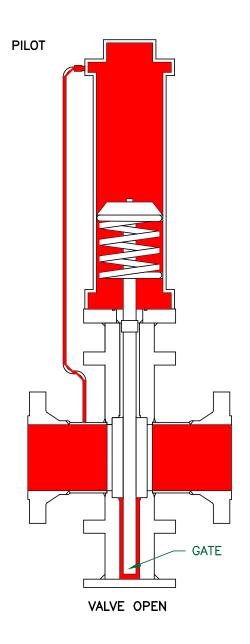

M&J reverse acting gate valves have the same tight shutoff and excellent delivery as standard M&J gate valves.
