I. SCOPE

The ADOT Materials Quality Assurance Program has been established in accordance with requirements of the *Code of Federal Regulations (23 CFR 637, Subpart B) - "Quality Assurance Procedure for Construction"* (See **Appendix D**). Documented herein are details of the ADOT Materials Quality Assurance Program and applicable policies, procedures, and guidelines.

The Quality Assurance Program represents the Department's commitment to consistently provide our customers with products and services that meet mutually agreed upon requirements. The program is intended to ensure all materials incorporated into ADOT projects satisfy specification requirements and to provide the highest degree of confidence in the reliability of tests performed by laboratories for ADOT projects.

This document has been prepared for utilizing materials acceptance procedures which are now generally employed by ADOT, i.e., acceptance sampling and testing being performed by ADOT or its designated agent(s).

The Quality Assurance Program is administered by the Materials Group Quality Assurance Section. Revisions to this program will be issued by the Quality Assurance Section through the authority of the Assistant State Engineer, Materials Group.

The Materials Quality Assurance Section maintains a website where information regarding its function can be found. Information regarding the "ADOT System for the Evaluation of Testing Laboratories", the ADOT "Directory of Approved Materials Testing Laboratories", the ADOT Laboratory Inspection Program, the ADOT Proficiency Sample Program, and Technician Certification may be obtained from the ADOT Materials Group, Quality Assurance Section website.

The "ADOT System for the Evaluation of Testing Laboratories" has been issued as Materials Policy and Procedure Directive (P.P.D.) No. 19. The ADOT Materials Policy and Procedure Directives Manual, which contains P.P.D. No. 19, can be obtained from the ADOT Materials Group, Materials Manuals website.

III. GLOSSARY OF TERMS

<u>Acceptance Program</u> - All factors used by the State to determine the quality of the product as specified in the contract requirements. These factors include acceptance sampling and testing, and inspection of materials and workmanship.

Acceptance Sampling and Testing - Sampling and testing performed to determine the quality and acceptability of the materials and workmanship incorporated in a project.

<u>Certification Acceptance Projects</u> - Federal-aid projects which are advertised, awarded, and administered by a Local Public Agency which satisfies the requirements of their ADOT/Local Public Agency certification agreement. See **Appendix A** for information regarding Local Public Agency quality assurance requirements.

Contractor Testing - Random sampling and testing and other operational techniques and activities that are performed by the contractor/vendor to fulfill the contract requirements. Contractor testing is normally sampling and testing performed by the contractor for quality control of its materials.

<u>Correlation Testing Program</u> - Testing performed to check or establish variability of testing procedures and equipment between testing laboratories. ADOT requires split samples be tested by the Project Laboratory and the Regional or Central Laboratory.

Independent Assurance Sampling and Testing Program - Activities that are an unbiased and independent evaluation of sampling and testing used in the acceptance program. Independent Assurance samples and tests or other procedures shall be performed by qualified State personnel, or State designated agents such as qualified consultants, who do not have direct responsibility for contractor or acceptance sampling and testing on a project. The results of independent assurance tests are not used for determining the quality and acceptability of the materials and workmanship. Tests performed by the Materials Group Central Laboratory for use in the acceptance decision are not covered by the Independent Assurance Sampling and Testing Program.

The independent assurance sampling and testing program employed by ADOT is comprised of two different approaches. Those approaches are the "Project Basis" and the "System Basis".

 The "Project Basis" is used for the majority of construction materials and consists of evaluating laboratories' testing equipment and personnel by inspections, I.A. split samples, and proficiency samples. Use of the "Project Basis" for independent assurance sampling and testing is described in Sections V(B)(1) and V(B)(2). • The "System Basis" is an alternate method which is used to satisfy the independent assurance sampling and testing requirements for certain items. Currently, those items are concrete mixture properties (other than compressive strength) and field density of compacted soil and aggregate materials. The "System Basis" approach is based on observing and verifying satisfactory performance by the individuals performing acceptance sampling and testing, and the equipment utilized, for a particular period of time, rather than performing independent assurance sampling and testing at specified frequencies for a specific project. Use of the "System Basis" for independent assurance sampling and testing at specified frequencies and testing is described in **Section V(B)(3)**.

Inspection - The process of observing, measuring, examining, testing, gauging, or otherwise evaluating materials, products, services, testing activities, and equipment.

Laboratory Technician - An employee of the laboratory who is assigned to perform the actual testing operations primarily conducted in the laboratory. Certain specifications may require technicians who are certified through appropriate certification programs determined by the Department.

<u>Proficiency</u> Sample Program - Homogeneous samples that are distributed and tested by two or more laboratories. The test results are compared to assure that the laboratories are obtaining results within prescribed limits of variability.

Qualified Laboratories - Laboratories which have been approved to perform testing activities for ADOT. These laboratories have met the requirements of the "ADOT System for the Evaluation of Testing Laboratories" (PPD No. 19). The ADOT "Directory of Approved Materials Testing Laboratories" lists laboratories meeting this criteria.

<u>Qualified Sampling and Testing Personnel</u> - Personnel who meet the requirements as established by ADOT.

Quality - Consistently conforming to mutually agreed upon requirements.

<u>Quality Assurance</u> - All those planned and systematic activities necessary to provide adequate confidence that a product or service satisfies given requirements for quality.

<u>Quality Assurance Program</u> - The organizational structure, policies, responsibilities, procedures, processes, and resources utilized for implementing quality assurance activities and ensuring continued compliance with applicable standards.

<u>Random Sample</u> - A sample drawn from a lot in which each increment in the lot has an equal probability of being chosen. All samples used for contractor or acceptance sampling and testing shall be random samples.

Testing Laboratory - An organization that measures, examines, performs tests; or otherwise determines the characteristics, properties, and performance of materials or products. ADOT issues the "Directory of Approved Materials Testing Laboratories" which lists testing laboratories approved to perform testing activities on ADOT projects.

<u>Vendor</u> - A supplier of project-produced material that is not the contractor.

V. QUALITY ASSURANCE

A. MATERIALS ACCEPTANCE

The quality of materials and construction incorporated into ADOT construction projects are controlled by sampling and testing, and accepted based on specification compliance. Compliance with specifications is determined by acceptance sampling and testing. All materials shall be randomly sampled at prescribed frequencies as given in the Sampling Guide Schedule, **Appendix C**. Sampling and testing shall be performed by qualified laboratories and by qualified sampling and testing personnel.

Reliance should not be placed wholly on the results of sampling and testing in determining the acceptability of materials and construction work. The sampling and testing should be supplemented by sufficient visual inspection of the materials to determine whether the samples and tests are reasonably representative. In addition, there should be sufficient observation of the construction operations and processes to assure uniformly satisfactory results.

1. Acceptance Sampling and Testing

The Sampling Guide Schedule (**Appendix C**) applies to sampling frequencies only for acceptance sampling and testing. It gives the material type to be sampled, the frequency of sampling, location of samples, and testing to be performed. Acceptance samples must be obtained randomly by ADOT technicians or ADOT designated agents.

In some cases, ADOT technicians or ADOT designated agents may not be allowed to physically perform the sampling of materials due to liability issues or safety and health regulations.

When directing and witnessing the sampling, both the name of the person physically performing the sampling and the name of the ADOT technician or ADOT designated agent directing and witnessing the sampling shall be noted on the sampling ticket.

After samples are taken, they shall be in the immediate custody of the ADOT technician or ADOT designated agent. Thereafter, the samples shall remain in ADOT's "chain of custody" until they are delivered to the appropriate laboratory for testing.

Note: During their initial cure, concrete cylinders may not be in ADOT's continual "chain of custody". If this is the case, appropriate measures shall be taken to ensure the integrity of the samples.

It is the intent of the Sampling Guide Schedule to provide guidance to personnel responsible for sampling and testing materials, yet allow reasonable latitude for adapting to specific project needs. The frequency may vary for individual projects or

phases of projects in accordance with job conditions, such as, the uniformity of materials at the source, the methods and equipment used, and weather conditions. The number of samples and locations from which they are taken should adequately assure or verify that the materials incorporated and construction produced are acceptable in accordance with the plans and specifications. The Engineer may direct that less acceptance sampling and testing be accomplished in particular cases he deems necessary provided concurrence from Materials Group is obtained. Conversely, the Engineer may direct that an amount of acceptance testing greater than the required minimum be done when he deems necessary.

The recommended number of acceptance samples is listed on a materials sample checklist [see **Section V(E)(1)**] issued for each project by the Quality Assurance Section. The number of samples given on the materials sample checklist is the recommended minimum derived from the project special provisions bidding schedule. For materials that are sampled on a time designated lot basis, an estimated lot quantity is used to determine the recommended number of acceptance samples.

2. Acceptance of Materials by Certification or Other Means

- Acceptance of materials by "Certificate of Compliance" or "Certificate of Analysis" will be in accordance with Subsection 106.05 of the specifications, Section 1000 of the ADOT Materials Testing Manual, and applicable ADOT Materials Policy and Procedure Directives.
- Small quantities may be accepted on the basis of certification or based upon visual observations of the Engineer. Small quantities may be considered to be approximately 500 cubic yards or less of processed aggregate material or approximately 20 tons of bituminous material, portland cement, or fly ash. A small quantity of portland cement concrete should be considered to be 5 cubic yards or less. The Engineer should exercise careful judgment in the acceptance of small quantities. Considerations must include the significance of the product to the construction as well as the quantity. The recommended sizes of small quantities are to be considered approximate, not maximums.
- Some materials are pre-sampled at the supplier's yard by the Regional or Central Laboratory, tested, and, if specifications are met, tagged with an ADOT green sticker showing the project number, lab number, lot number, individual approving material, and date of approval. Such materials include, but not are limited to, concrete curing compounds, precast concrete pipes, and glass beads. For materials that are "green tagged", it may not be necessary to do any further sampling and testing. However, the proper laboratory should be contacted for verification of the materials acceptability.

 Some materials approved for use are shown on the Department's Approved Products List (APL). This list includes products that have been pre-tested and found acceptable for Department use; however, when such products are used they must also meet the requirements of the Sampling Guide Schedule (Appendix C) and/or the requirements of the specifications. Copies of the most current version of the APL are available on the internet from the ADOT Research Center, through its Product Evaluation Program.

B. INDEPENDENT ASSURANCE SAMPLING AND TESTING

The Code of Federal Regulations (23 CFR 637, Subpart B) (See **Appendix D**) requires the implementation of an Independent Assurance Program. Its definition of an independent assurance program is as follows:

"Activities that are an unbiased and independent evaluation of all the sampling and testing procedures used in the acceptance program."

The independent assurance program evaluates the sampling/testing personnel and testing equipment used in acceptance of materials. The Code of Federal Regulations allows obervations, split sample results, and proficiency sample results as means of evaluating testing personnel within a State's independent assurance program. Calibration checks, split sample results, and proficiency sample results are permissible inclusions to the I.A. program for evaluating acceptance testing equipment. The independent assurance program does not directly determine the acceptability of materials.

For the majority of construction materials used for ADOT projects, the independent assurance sampling and testing requirements are satisfied using the "Project Basis", as described in **Sections V(B)(1) and V(B)(2)**. Using the "Project Basis", ADOT evaluates laboratories' testing equipment and personnel by obtaining and testing I.A. samples and splits of those samples.

The Regional Materials Engineers are responsible for administering the "Project Basis" independent assurance program; they provide personnel and equipment to obtain the independent assurance samples. Communication shall be maintained between project and regional lab personnel to assure timely independent assurance sampling and testing is accomplished commensurate with project progress.

A "System Basis" is used to satisfy the independent assurance sampling and testing requirements for certain items. Currently, those items are concrete mixture properties (other than compressive strength) and field density of compacted soil and aggregate materials. The "System Basis" is described in **Section V(B)(3)**.

Materials requiring independent assurance sampling and testing are outlined in the Sampling Guide Schedule (**Appendix C**).

1. Frequency of Independent Assurance Sampling and Testing when the "Project Basis" is used

For independent assurance sampling and testing administered under the "Project Basis", the frequency of sampling for independent assurance is a function of the number of samples used for acceptance on a project basis. Unless a material is represented by a small quantity, at least one I.A. sample is required for each qualifying material type on each project.

Independent assurance samples shall be of sufficient quantity for a split to be tested by the project laboratory.

Independent assurance (I.A.) sampling and testing shall be performed as early as possible after production or placement of the material begins.

I.A. sampling shall be performed by the individual(s) designated by the respective Regional Materials Engineer.

I.A. testing shall be performed by the laboratory/individual(s) designated by the respective Regional Materials Engineer.

The minimum frequency of independent assurance sampling and testing is given below.

- For asphaltic concrete produced under Specifications 415, 416, or 417:
 - One independent assurance <u>bituminous mixture</u> sample shall be taken for every 5 acceptance lots. The I.A. sample shall be taken at a different location than any acceptance sample, and split with the laboratory performing acceptance testing. At least one I.A. bituminous mixture sample is required for each project having less than 5 acceptance lots.
 - Independent assurance sampling and testing, other than gradation, shall be performed on <u>mineral aggregate</u> for the bituminous mixture at the rate of one I.A. sample for every 40 acceptance samples.
 - I.A. samples for <u>compaction</u> (separate cores) will <u>not</u> be taken.
- For asphaltic concrete produced under Specifications 407, 413, or 414:
 - Independent assurance sampling and testing for the <u>bituminous mixture</u> shall consist of observing the acceptance sampling and testing at a rate of one I.A. sample for every 20 acceptance samples.

- Independent assurance sampling and testing shall be performed on <u>mineral aggregate</u> for the bituminous mixture at the rate of one I.A. sample for every 40 acceptance samples.
- For <u>Class P portland cement concrete</u>:
 - One independent assurance <u>concrete mixture</u> sample for compressive strength shall be taken for every 5 acceptance lots. The I.A. sample shall be taken at a different location than any acceptance sample, and split with the laboratory performing acceptance testing. At least one I.A. concrete mixture sample for compressive strength is required for each project having less than 5 acceptance lots.
 - Independent assurance sampling and testing of the <u>concrete mixture</u>, other than for compressive strength, shall consist of meeting the requirements for the "system basis" described in **Section V(B)(3)**.
 - Independent assurance sampling and testing shall be performed on <u>aggregate</u> for the concrete mixture at the rate of one I.A. sample for every 40 acceptance samples.
- For <u>Class S or B portland cement concrete</u>:
 - Independent assurance sampling and testing for compressive strength of the <u>concrete mixture</u> shall be performed at the following rate: for Class S concrete, one I.A. sample for every 25 acceptance samples; for Class B concrete, one I.A. sample for every 40 acceptance samples. For I.A. split comparison results, duplicate sets of samples shall be taken, prepared, and tested.
 - Independent assurance sampling and testing of the <u>concrete mixture</u>, other than for compressive strength, shall consist of meeting the requirements for the "system basis" described in **Section V(B)(3)**.
 - Independent assurance sampling and testing shall be performed on aggregate for the concrete mixture at the rate of one I.A. sample for every 40 acceptance samples.
- For <u>all other materials</u> subject to I.A. sampling and testing (as indicated in the Sampling Guide Schedule, **Appendix C**):
 - One I.A. sample shall be taken for every 40 acceptance samples.

2. Comparison and Reporting of Independent Assurance Sampling and Testing when the "Project Basis" is used

For independent assurance sampling and testing administered under the "Project Basis", each I.A. sample will normally have an I.A. split run by the ADOT acceptance

lab, with some exceptions as noted below. I.A. sample results shall be promptly compared to I.A. split sample results.

- For asphaltic concrete produced under Specifications 415, 416, or 417:
 - I.A. samples of <u>bituminous mixture</u> are split with the acceptance lab. The I.A. and the acceptance lab split test results are used only for evaluating the equipment and personnel. They are not to be used in the statistical acceptance of the respective lot from which the I.A. sample was taken.
 - Each I.A. test result for samples of <u>mineral aggregate</u> for the bituminous mixture, other than gradation, is compared to its I.A. split result.
- For asphaltic concrete produced under Specifications 407, 413, or 414:
 - Each observation performed for independent assurance sampling and testing of the <u>bituminous mixture</u> shall be documented by recording the date of each observation, name of the test operator performing the acceptance sampling and testing, and the acceptability of the sampling and testing performed.
 - Each I.A. test result for samples of <u>mineral aggregate</u> for the bituminous mixture is compared to its I.A. split result.
- For <u>Class P portland cement concrete</u>:
 - I.A. samples for compressive strength of the <u>concrete mixture</u> are split with the acceptance lab. The I.A. and the acceptance lab split test results are used only for evaluating the equipment and personnel. They are not to be used in the statistical acceptance of the respective lot from which the I.A. sample was taken.
 - Each I.A. test result for samples of <u>aggregate</u> for the concrete mixture is compared to its I.A. split result.
- For <u>Class S or B portland cement concrete</u>:
 - Each I.A. test result for compressive strength of the <u>concrete mixture</u> is compared to its I.A. split result.
 - Each I.A. test result for samples of <u>aggregate</u> for the concrete mixture is compared to its I.A. split result.

- For <u>all other materials</u> subject to I.A. sampling and testing (as indicated in the Sampling Guide Schedule, **Appendix C**):
 - Each I.A. test result is compared to its I.A. split result.

For a favorable comparison, each specified test characteristic must be within the allowable variation listed in **Figure 1** for "SAMPLE RESULT vs. SPLIT RESULT".

The Regional Materials Engineer is responsible to determine allowable variations for test characteristics not listed in **Figure 1**.

An example of the comparison of test results and the report of Independent Assurance Sampling and Testing performed is given in **Figure 2**.

If there are no unfavorable comparisons, the results of the independent assurance testing shall be reported by the Regional Materials Engineer to the Resident Engineer/Project Lab within five working days of receiving the sample in the I.A. testing laboratory.

If there are any unfavorable comparisons, an investigation shall be initiated to determine the cause of the discrepancy. The investigation may include a check of the test data, calculations, and results; an inspection of the equipment used to perform the testing; a discussion with the test operators regarding their knowledge of the procedure in question; retesting of samples; exchanging samples; and observation of each other's techniques. When the problem is isolated, the steps taken to resolve it shall be documented. The results of the I.A. testing, comparisons, findings, and resolutions shall be reported by the Regional Materials Engineer to the Resident Engineer/Project Lab in a prompt and timely manner.

When Central Lab performs testing of independent assurance samples:

- If there are no unfavorable comparisons, the results will be communicated to the Regional Materials Engineer who will notify the Resident Engineer/Project Lab within five working days of receipt of the sample by Central Lab.
- If there are any unfavorable comparisons, they shall be investigated as described above and a report of the results of the I.A. testing, comparisons, findings, and resolutions shall be communicated to the Regional Materials Engineer, who will notify the Resident Engineer/Project Lab in a prompt and timely manner.

When an I.A. split is used as an acceptance sample, it is recorded as an acceptance test on the project Materials Sample Checklist.

EXAMPLE REPORT OF INDEPENDENT ASSURANCE SAMPLING AND TESTING

3. Use of the "System Basis" for Independent Assurance Sampling and Testing Requirements for Certain Materials

The "system basis" outlined below is an alternate I.A. method which is based on observing and verifying satisfactory performance by the individuals performing acceptance sampling and testing, and the equipment utilized, for a particular period of time, rather than performing independent assurance sampling and testing at specified frequencies for a specific project.

The "system basis" is used to satisfy the requirements for independent assurance sampling and testing only for certain materials. Currently, the materials for which the "system basis" is applicable are concrete mixture properties (other than compressive strength) and field density of compacted soil and aggregate materials.

The objective of the "system basis" is to observe and verify that the the individuals performing acceptance sampling and testing, and the equipment utilized, are qualified for a twelve month period. Ideally, all individuals who are performing such sampling and testing, and the equipment utilized, in a given twelve month period would be covered by this verification. It is recognized that this may not be possible in all cases. In the first 12 months of this program, a target of 75 percent of all technicians performing acceptance sampling and testing on ADOT projects for concrete mixture properties (other than compressive strength) and field density of compacted soil and aggregate materials will be identified, observed, and verified. In subsequent 12-month periods, it is anticipated that the target percentage will be increased.

The "system basis" is a more effective means of performing independent assurance sampling and testing than performing independent assurance sampling and testing at specified frequencies for a specific project since it ensures that most of the individuals performing acceptance sampling and testing are reviewed and that the same individuals are not continually reviewed.

ADOT Materials Group has implemented a system by which the majority of individuals performing acceptance sampling and testing, and the equipment utilized, are identified, observed, and verified for each twelve month period. The Regional Materials Engineers and the Materials Quality Assurance Section will administer the I.A. "System Basis" program.

For each twelve month period, the Assistant State Engineer, Materials Group, will submit a report to the FHWA documenting activities of the I.A. "System Basis" program. The report will include the following information:

- 1. Names and number of technicians performing acceptance sampling and testing of concrete mixture properties (other than compressive strength) and field density of compacted soil and aggregate materials on ADOT projects.
- 2. Number of such technicians evaluated by the program.
- 3. Number of such technicans that had deviations, as determined by the evaluation.
- 4. Summary of how the deviations were addressed, along with any potential systematic solutions to recurring deficiencies.
- 5. Goals for the upcoming twelve month period.

C. CORRELATION TESTING

Correlation testing is a quality assurance activity conducted to supplement independent assurance sampling and testing. Correlation testing provides a method to isolate problems that originate from sample splitting or testing error. Correlation samples are taken by Project Lab personnel and are split with the Regional Lab unless otherwise directed by the Regional Materials Engineer.

1. Frequency of Correlation Testing

At the prescribed frequency given below, a representative split of acceptance samples taken on the project is obtained for correlation testing. The correlation split samples shall be properly indentifed and promptly submitted to the Regional Lab for testing. The correlation split will be of sufficient size for the Regional Lab to duplicate the testing that is performed at the Project Lab.

Correlation testing shall be preformed at a minimum frequency of one correlation sample split for every five acceptance samples. Every effort should be made to obtain a correlation split sample from the first acceptance sample. If favorable comparisons are achieved on three consecutive correlation splits for a given material, the Regional Materials Engineer may revise the correlation frequency for that material to a minimum of one correlation sample split for every ten acceptance samples.

- For asphaltic concrete produced under Specifications 415, 416, or 417:
 - Correlation testing is <u>not</u> performed on the <u>bituminous mixture</u>.
 - Correlation testing, other than gradation, shall be performed at the frequency described above on <u>mineral aggregate</u> materials for the bituminous mixture.
- For asphaltic concrete produced under Specifications 407, 413, or 414:
 - Correlation testing is <u>not</u> performed on the <u>bituminous mixture</u>.
 - Correlation testing shall be performed at the frequency described above on mineral aggregate materials for the bituminous mixture.
- For <u>Class P, S, or B portland cement concrete</u>:
 - Correlation testing is <u>not</u> performed on portland cement <u>concrete mixtures</u>.
 - Correlation testing shall be performed at the frequency described above on the <u>aggregate</u> materials for the concrete mixture.
- For <u>all other materials</u> subject to correlation testing:
 - Correlation testing shall be performed at the frequency described above.

2. Comparison and Reporting of Correlation Testing

The Regional Materials Engineer or their designated representative will compare the results of tests performed on the acceptance sample and the correlation split. For a favorable comparison, each specified test characteristic must be within the allowable variation listed in **Figure 1** for "SAMPLE RESULT vs. SPLIT RESULT".

The Regional Materials Engineer is responsible to determine allowable variations for test characteristics not listed in **Figure 1**.

An example of the comparison of test results and the report of Correlation Sampling and Testing performed is given in **Figure 3**.

If there are no unfavorable comparisons, the results of the correlation testing shall be reported by the Regional Materials Engineer to the Resident Engineer/Project Lab within five working days of receiving the sample in the correlation testing laboratory.

ADOT MATERIALS QUALITY ASSURANCE PROGRAM

EXAMPLE REPORT OF CORRELATION SAMPLING AND TESTING

If there are any unfavorable comparisons, an investigation shall be initiated to determine the cause of the discrepancy. The investigation may include a check of the test data, calculations, and results; an inspection of the equipment used to perform the testing; a discussion with the test operators regarding their knowledge of the procedure in question; retesting of samples; exchanging samples; and observation of each other's techniques. When the problem is isolated, the steps taken to resolve it shall be documented. The results of the correlation testing, comparisons, findings, and resolutions shall be reported by the Regional Materials Engineer to the Resident Engineer/Project Lab in a prompt and timely manner.

When Central Lab performs testing of correlation samples:

- If there are no unfavorable comparisons, the results will be communicated to the Regional Materials Engineer who will notify the Resident Engineer/Project Lab within five working days of receipt of the sample by Central Lab.
- If there are any unfavorable comparisons, they shall be investigated as described above and a report of the results of the correlation testing, comparisons, findings, and resolutions shall be communicated to the Regional Materials Engineer, who will notify the Resident Engineer/Project Lab in a prompt and timely manner.

D. CONTRACTOR TESTING

When specified by Standard Specifications or Special Provisions, the contractor is required to perform specific sampling, testing, and other related activities. The primary purpose of contractor sampling and testing is to assure the contractor that their process is in control and producing a product satisfying ADOT contractual specifications.

Contractor sampling and testing shall be performed by qualified technicians and testing laboratories. Laboratory and technician qualification requirements are presented in the "ADOT System for the Evaluation of Testing Laboratories" (PPD No. 19). Laboratories satisfying the "ADOT System for the Evaluation of Testing Laboratories" are listed in the ADOT "Directory of Approved Materials Testing Laboratories", which is updated monthly. Information on accessing/obtaining the "ADOT System for the Evaluation of Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" and the ADOT "Directory of Approved Materials Testing Laboratories" is given in **Section I**.

The Resident Engineer has the responsibility and authority to review and approve contractor sampling and testing activities. Project personnel are also responsible for monitoring the contractor's performance and compliance with specification requirements. When requested by the Project or District, Materials Quality Assurance Section will perform an inspection of the contractor's testing laboratory in accordance with **Section VI (A)**.

E. FINAL CERTIFICATION OF MATERIALS INCORPORATED IN THE WORK

The following information outlines the procedure to be followed in certifying that the materials incorporated in the construction work, and the construction operations controlled by sampling and testing, were in conformity with the approved plans and specifications.

A "Final Materials Certification Flow Chart" is given in **Figure 9**. This flow chart provides a brief illustration of the Materials Certification requirements described herein.

For Local Public Agency projects, the final certification of materials incorporated in the work is described in **Appendix A**.

For Consultant Administered Projects, the final certification of materials incorporated in the work is described in **Appendix B**.

1. Materials Sample Checklist

Materials Group, Quality Assurance Section, will originate the project "Materials Sample Checklist" recommending the number of acceptance, independent assurance, and correlation samples to be taken for each material. Materials that are not listed, but are accepted by testing shall be added to the sample checklist by the project. "As-Built" quantities that are substantially different from plans quantities shall be noted on the sample checklist and the Quality Assurance Section contacted for revised sampling and testing requirements. A blank sample checklist and cover letter are given in **Figures 4 through 6**. Upon completion of each project, the sample checklist shall be completed and signed by the Resident Engineer, and submitted to the Regional Materials Engineer for review.

2. Materials Certificate Log

A "Materials Certificate Log" shall be maintained in accordance with Series 1000 of the Materials Testing Manual. Upon completion of each project, the Materials Certificate Log shall be signed by the Resident Engineer. A copy of the log shall be attached to the Materials Sample Checklist and submitted to the Regional Materials Engineer for review.

Intermodal Transportation

MEMORANDUM

- TO: (Name) Construction Supervisor (District Name) (Mail Drop)
- FROM: (Name) Quality Assurance Engineer Materials Group (068-R)
- CC: (Name) Regional Materials Engineer (Name) Regional Materials Lab

DATE: (Mon. Day, Year)

RE: PROJECT NO. PROJECT NAME

(Project Location)

Materials Group has prepared the following checklist of the materials to be used in constructing this project which require testing for approval. The number of recommended samples for acceptance (ACCP), independent assurance (IAS), and correlation (CORR) testing are derived from the "Materials Quality Assurance Program" (Series 900 of the Materials Testing Manual) which includes the Sampling Guide Schedule (Appendix C). The recommendations are estimates for the plan quantity and may change due to actual material production rates. Documentation must be provided in the Materials Exception Report if the required testing detailed in the Sampling Guide Schedule is not performed. All materials used on the project which require testing should be listed. Materials used which were not originally listed should be added.

Acceptance samples taken by the project are to be recorded under the ACCP SAMPLES TAKEN BY PROJECT column, regardless of where the tests are performed. The number of samples tested shall be recorded in the appropriate column. Acceptance testing performed by the project is to be recorded under the ACCP SAMPLES TESTED BY PROJECT column, acceptance testing performed by the Regional Lab is to be recorded under the REGIONAL ACCP column, and acceptance testing performed by the Central Lab is to be recorded under the CENTRAL ACCP column. Independent assurance sample splits used for acceptance testing performed by the Regional Lab is to be recorded under the REGIONAL ACCP column for the lab performing the acceptance testing. Correlation testing performed by the Regional Lab is to be recorded under the recorded under the ACCP column for the lab performing the testing. Independent assurance sample testing is to be recorded under the REGIONAL LAS or CENTRAL IAS columns.

Upon completion of the project, the Materials Sample Checklist shall be signed and submitted to the Regional Materials Engineer for review and signature. A copy of the completed and signed Certificate Log(s) shall be attached to the Materials Sample Checklist. These documents shall be forwarded to the District Engineer for review and approval. The District Engineer will then forward the Sample Checklist, Certificate Log, Exception Report (if needed) and Certification Letter to the Quality Assurance Engineer, Materials Group.

Glass Beads, Concrete Curing Compound, Geosynthetics, and Paint should be pre-approved by Central Lab prior to use. If not pre-approved by Central Lab, obtain samples for testing by the Central Lab as detailed in the applicable Policy and Procedures Directive (PPD). Water utilized for concrete batching does not require sampling if obtained from a potable source. See Section 900 appendix C – Sampling Guide Schedule of the Materials Testing Manual if there are questions on sampling

3. Materials Certification / Exception Report

The materials records for each project shall be reviewed by the Resident Engineer. A "Materials Certification / Exception Report" shall then be prepared by the Resident Engineer. The Materials Certification / Exception Report must include at a minimum the following statement:

"I certify that I have reviewed the materials records for the above referenced project. The results of the tests used in the acceptance program indicate that the materials incorporated in the construction work, and the construction operations controlled by sampling and testing, were in conformity with the approved plans and specifications. In addition, all material sampling and testing was performed in accordance with the ADOT Materials Quality Assurance Program."

Any exceptions to the certification shall be detailed in the report. Exceptions may include, but are not limited to, the following: material represented by failing tests which has been incorporated into the work, inadequate certificates, insufficient sampling and testing, and other deficiencies in meeting the requirements of the Materials Quality Assurance Program. Each exception, including exceptions that are covered by supplemental agreements, must be listed and explained in the report. The explanation shall include the corrective action taken to remedy the exception, including references to any supplemental agreements that provided for changes in specifications and/or acceptance of the material.

The Materials Certification / Exception Report shall be signed by the Resident Engineer and be submitted with the Materials Sample Checklist to the Regional Materials Engineer for review.

An example Materials Certification / Exception Report is given in Figure 7.

4. Regional Material Engineer's Responsibilities

The Regional Materials Engineer shall review the completed Materials Sample Checklist, Materials Certificate Log, and Materials Certification / Exception Report. If necessary, they shall be returned to the Resident Engineer for correction. The Regional Materials Engineer shall also review the results of correlation and independent assurance sampling and testing for the project.

I certify that I have reviewed the materials records for the above referenced project. The results of the tests used in the acceptance program indicate that the materials incorporated in the construction work, and the construction operations controlled by sampling and testing, were in conformity with the approved plans and specifications. In addition, all material sampling and testing was performed in accordance with the ADOT Materials Quality Assurance Program.

Exceptions to the above certification are as follows:

1. Lots #1 and #2 of section 416 Asphaltic Concrete (End Product) paving, were in reject, but were allowed to remain in place at the maximum negative penalty (see Memo from Materials Group dated March 8, 2013).

2. Two-point barbed wire was installed rather than the 4-point barbed wire required in the project plans. This change was initiated by the State Game and Fish Department and is documented in Change Order #7.

3. An insufficient number of Aggregate Base correlation samples were obtained. Correlation frequency requirements have been reviewed with the proper personnel to ensure an adequate number of samples are obtained in the future.

> ARIZONA DEPARTMENT OF TRANSPORTATION 206 S. 17th Ave. | Phoenix, AZ 85007 | azdot.gov

EXAMPLE MATERIALS CERTIFICATION/EXCEPTION REPORT

Figure 7 (Continued on next page)

MATERIALS CERTIFICATION / EXCEPTION REPORT Fed. Proj. No: (______) TRACS No. (_____) PROJECT NAME/DESCRIPTION: (______) Date (Month, Day, Year) Page 2

4. Concrete Curing Compound: The contractor did not supply an acceptable Certificate of Compliance for curing compound that was used on the project. The project personnel were advised to review the Materials Certification requirements to prevent recurrence.

5. One of seventeen cover material acceptance tests failed on the #4 screen at 12% passing vs. 10% passing specification. Results of the other 16 acceptance tests met specification. The material was judged to be in substantial conformance by the Resident Engineer and was left in place with no penalties.

6. Concrete cylinders for the sidewalk at station 15+10 failed to meet the required compressive strength of 3000 psi. The strength average was 2850 psi. A penalty of 6% was applied to the contract unit price for the sidewalk represented by the testing results.

7. The slump of the first load of concrete for the box culvert at station 67+45 was measured at 2.75 inches. The submitted mix design required a slump of 3 to 5 inches. The slump was adjusted at the batch plant and all future loads had the required slump. All concrete met compressive strength requirements.

8. It was found that Joe Tester, who performed acceptance testing on concrete, did not have a current "ACI Concrete Field Testing Technician Grade I" certification. The project will monitor technician certifications more closely on future projects.

(Name) Resident Engineer

EXAMPLE MATERIALS CERTIFICATION/EXCEPTION REPORT

Figure 7 (Continued from previous page))

The Regional Materials Engineer shall then prepare a "Final Materials Certification" on behalf of the District Engineer. The Final Materials Certification must include at a minimum the following statement:

"The results of the tests used in the acceptance program indicate that the materials incorporated in the construction work, and the construction operations controlled by sampling and testing, were in conformity with the approved plans and specifications. In addition, all material sampling and testing was performed in accordance with the ADOT Materials Quality Assurance Program."

If there are exceptions, the Final Materials Certification shall also state, "See exceptions listed in the attached Materials Certification / Exception Report."

If independent assurance or correlation testing were required, the Final Materials Certification must also include the following statement:

> "Independent assurance sampling and testing, and correlation testing, were performed in accordance with the ADOT Materials Quality Assurance Program. Results of this testing compared favorably with the results of acceptance sample testing."

If independent assurance or correlation testing were not required, the above statement shall be modified accordingly.

Significant deviations in the required independent assurance sampling and testing or correlation testing shall be noted in the Final Materials Certification as exceptions.

The Final Materials Certification shall be signed by the Regional Materials Engineer and forwarded, along with the Materials Sample Checklist, Materials Certificate Log, and Materials Certification / Exception Report, to the District Engineer for review and signature.

An example Final Materials Certification is given in **Figure 8**.

EXAMPLE FINAL MATERIALS CERTIFICATION

5. Certification of Materials for Federal-Aid Projects

The Final Materials Certification, including attachments (Materials Sample Checklist, Materials Certificate Log, and Materials Certification / Exception Report), shall be sent to the Assistant State Engineer, Materials Group. The Assistant State Engineer, Materials Group, will review the documentation furnished by the District Engineer. Based on this documentation, the Assistant State Engineer, Materials Group, will prepare and submit a certification letter to the Federal Highway Administration. Accompanying that certification letter will be а CODV of the Materials Certification / Exception Report. A copy of the certification letter and supporting documentation will be maintained on file by the Materials Group Quality Assurance Section.

6. Certification of Materials for Non Federal-Aid Projects

The Final Materials Certification, including attachments (Materials Sample Checklist, Materials Certificate Log, and Materials Certification / Exception Report), shall be sent to the Assistant State Engineer, Materials Group. The Materials Group, Quality Assurance Section, will review the documentation furnished by the District Engineer. Based on this documentation, the Materials Group, Quality Assurance Section, will prepare a certification letter. The certification letter and supporting documentation will be maintained on file by the Materials Group Quality Assurance Section.

VI. LABORATORY QUALIFICATIONS

The "ADOT System for the Evaluation of Testing Laboratories" (PPD No. 19) details the requirements that laboratories must satisfy to be approved for performing testing activities for ADOT. In addition to being AASHTO certified through the AASHTO Accreditation Program (AAP), laboratories must participate in the ADOT Laboratory Inspection Program and the ADOT Proficiency Sample Program. AAP accreditation and ADOT approval must be received for all test methods that are to be performed on ADOT projects. Laboratories which have been approved to perform testing activities on ADOT projects are listed in the ADOT "Directory of Approved Materials Testing Laboratories". Included in that directory are the individual tests for which a laboratory has been approved.

FINAL MATERIALS CERTIFICATION FLOW CHART

A. ADOT LABORATORY INSPECTION PROGRAM

The Quality Assurance Section of Materials Group administers an inspection program of all materials testing laboratories performing testing activities for the Department. Compliance to test procedures and equipment requirements are included in the inspection. All laboratories performing Acceptance or Referee testing are inspected on a frequency not to exceed 18 months. Information regarding the ADOT Laboratory Inspection Program is also available on the ADOT Materials Group, Quality Assurance Section website.

1. Participation

All independent, contractor, materials supplier, government, and other testing laboratories desiring to perform testing activities for ADOT must submit to an inspection as specified in the "ADOT System for the Evaluation of Testing Laboratories" (PPD No. 19). The inspection considers those elements of service that the respective laboratory proposes to offer to the Department. This requirement includes laboratories submitting asphaltic concrete mix designs and those performing acceptance and referee testing for the Department.

The Quality Assurance Section will inspect only laboratories that are involved, or seeking involvement, in an activity related to the design or construction of an ADOT project.

2. Equipment Inspection

The laboratory equipment inspection will consist of checking dimensional, calibration, and specification conformance of all apparatus and equipment required by the test procedures contained in the Materials Testing Manual or other applicable specifications. Equipment related documentation, required by AASHTO R18, is also checked during this inspection. This inspection is not a calibration service for non-ADOT laboratories. Any equipment found unacceptable must be repaired, properly calibrated, or removed from service at the expense of the owner laboratory. Laboratory facilities will also be checked for compliance with applicable standards, such as, proper temperature and humidity control.

Documentation of the calibration and verification of equipment used in field testing which is not available during the inspection will be reviewed for compliance with applicable requirements.

3. Procedural Inspection

The procedural inspection serves as a tool to evaluate the performance of laboratory technicians when performing tests in accordance with the ADOT Materials Testing Manual or other applicable specifications. Arizona, AASHTO, and ASTM test methods referenced in the Materials Testing Manual will be observed. In the event that Arizona Test Methods deviate from those given in a similar AASHTO or ASTM procedure, the Materials Testing Manual will govern.

4. Procedure and Report

The equipment and procedural inspections are normally conducted simultaneously; however, circumstances may dictate independent inspections. The inspection formats will generally conform to the techniques employed by AMRL and CCRL, as appropriate. When a departure from the requirements of a test method is observed by the inspectors, they will point it out to the laboratory personnel so that immediate corrections can be made if possible. The inspectors will present a summary of their findings and identify deficiencies requiring corrective action at an informal exit review where any deficiencies discovered can be discussed openly. It is requested that the Laboratory Manager and Supervising Engineer be present at the exit review.

A written inspection report will be issued by the Quality Assurance Section to the laboratory that has been inspected. The laboratory must provide the Quality Assurance Engineer with satisfactory responses to the noted deficiencies within 30 days of the report issuance. The responses must provide satisfactory evidence that all significant deficiencies were corrected or that corrective action is in progress. The laboratory's inspection and responses will be considered when evaluating ADOT eligibility.

B. ADOT PROFICIENCY SAMPLE PROGRAM

The Quality Assurance Section administers the ADOT Materials Proficiency Sample Program. The program allows participants to evaluate the reliability of their testing by comparing their test results to a population of test data generated by all participants. Specified routine tests are performed in accordance with standard Arizona and AASHTO test methods by each participating laboratory on carefully prepared samples of highway construction materials and the test results reported to ADOT for review and analysis. Information regarding the ADOT Proficiency Sample Program is also available on the ADOT Materials Group, Quality Assurance Section website.

1. Participation

Participation in the ADOT Proficiency Sample Program is required for all laboratories performing Acceptance or Referee testing activities for the Department, as specified in
the ADOT "System for the Evaluation of Testing Laboratories" (PPD No. 19). Participation by government agency laboratories not performing testing activities for the Department is voluntary.

2. Proficiency Samples

Proficiency samples are carefully prepared to be as homogeneous as possible to minimize the effect of material variability in evaluating the results. Each sample is sequentially numbered and, using random numbers, a set of samples is allocated to each participant. To permit an estimate of single-operator precision, instructions are given for a single test operator to conduct all repetitions of an individual test method; however, it is not required that the same person conduct all test methods prescribed for a set of proficiency samples.

The program generally provides 8 to 10 proficiency samples per year. Typically, the material types and routine tests performed are:

- **Soil** Gradation, Atterberg limits (PI), pH, resistivity, and moisture-density relations.
- Fine Aggregate Gradation, sand equivalent, fine specific gravity, absorption, and uncompacted void content.
- **Coarse Aggregate** Gradation, specific gravity, absorption, L.A. Abrasion, unit weight, fractured coarse aggregate particles, flakiness index, and percent carbonates.
- Asphaltic Concrete Asphalt content, maximum theoretical specific gravity/density (Rice), Marshall stability/flow, Marshall compaction/density, gyratory compaction/density, moisture content, and gradation of mineral aggregate.
- **Portland Cement Concrete** 7-day and 28-day compressive strengths of prepared cylinders.
- Asphalt Cement/Binder Rotational viscosity, pressurized aging, bending beam rheometer, and dynamic sheer rheometer.
- Emulsified Asphalt Saybolt-Furol viscosity, % residue, % uncoated particles, absolute viscosity, and sieve test.

3. Analysis/Reporting of Proficiency Sample Results

Proficiency sample test results are required to be submitted promptly upon completion of testing to the Quality Assurance Section no later than a specified date. All test data submitted is analyzed similar to the method presented in the paper: *"Statistical Evaluation of Interlaboratory Cement Tests"* by J. R. Crandall and R. L. Blaine, Volume 59 (1959) of the Proceedings of the American Society for Testing and Materials. A final report summarizing the results of the analysis is issued for each proficiency sample. The final report presents a statistical summary of results for the population of test data and a tabulation of each laboratory's individual data. Statistical characteristics presented are averages, standard deviations, coefficients of variation, z-scores, and performance ratings. The z-score is equal to the number of standard deviations the data departs from the population mean. A laboratory's performance ratings are based on the following scale:

Rating	Standard Deviations from Mean (z-score)
5	0 to <u><</u> 1.0
4	> 1.0 to <u><</u> 1.5
3	> 1.5 to <u><</u> 2.0
2	>2.0 to <u><</u> 2.5
1	>2.5 to <u><</u> 3.0
0	> 3.0; eliminated from analysis
N	No data received

All data submitted is initially reviewed and analyzed. Invalid data is eliminated, then the remaining data is reanalyzed and presented in the proficiency sample final report. A single low rating, or a pair of low ratings, is not considered significant. A continuing trend of low ratings for a test characteristic should cause a laboratory to investigate its equipment and test methodology.

The "History of Z – Scores" charts accompany each proficiency sample final report. These charts show a laboratory's performance trend for each test characteristic. In addition, scatter diagrams are included in each proficiency sample report for each test characteristic. A scatter diagram shows each laboratory's reported results as a point on the graph, relative to the population averages for that test.

Participating laboratories are required to investigate the reason for discrepancies when their results are 2 or more standard deviations from the population average values (rating of 2 and less). The laboratories must report findings and corrective actions to the Quality Assurance Section within 30 days of the final report issuance. The

performance and adequacy of the laboratory's responses will be considered when evaluating the eligibility of the laboratory to conduct testing activities for ADOT.

C. CONFLICT OF INTEREST

In order to avoid a conflict of interest, any qualified laboratory shall perform only one of the following types of testing on the same project: Acceptance testing, contractor testing, Independent Assurance testing, or dispute resolution (referee) testing. Independent assurance testing and correlation testing are performed as described herein.

VII. SAMPLING AND TESTING PERSONNEL QUALIFICATION REQUIREMENTS

All personnel supervising or performing sampling and testing activities for ADOT must meet the qualification requirements given in the table below.

Soils and Aggregate						
Field Laboratory						
Arizona Technical Testing Institute (ATTI) "Field" certification.	Arizona Technical Testing Institute (ATTI) "Laboratory Soils/Aggregate" certification.					
Asphaltic	Concrete					
Field	Laboratory					
Arizona Technical Testing Institute (ATTI) "Field" certification.	Arizona Technical Testing Institute (ATTI) "Asphalt" certification.					
Cond	crete					
Field	Laboratory					
American Concrete Institute (ACI) "Concrete Field Testing Technician Grade I" certification.	American Concrete Institute (ACI) "Concrete Strength Testing Technician" certification.					

Information regarding requirements for the qualification of sampling and testing personnel is also available on the ADOT Materials Group, Quality Assurance Section website.

Individuals performing sampling and testing activities for ADOT who are not employed by ADOT or who are not associated with a laboratory which has met the requirements of the "ADOT System for the Evaluation of Testing Laboratories" must, in addition to meeting the qualification requirements specified in the above paragraph, utilize equipment and apparatus which has been inspected and found acceptable. Inspection of equipment and apparatus must be performed at the intervals specified in Appendix A3 of the ADOT Materials Testing Manual. Documentation of equipment and apparatus inspection(s) shall be properly maintained. Upon request by the Department, that documentation shall be made available for review. All equipment and apparatus shall be maintained in good working order. Inspection of equipment and apparatus shall be performed by either:

- An AASHTO accredited laboratory that has been approved by ADOT.
- An individual or company who, as a business, performs inspection and calibration of sampling and testing equipment.

Inspections and calibrations must be performed in accordance with established ADOT, AASHTO, ASTM, and *National Institute of Standards and Technology* (NIST) specifications. Proper calibration equipment that is traceable to NIST standards shall be used.

This page intentionally left blank.

A1. SCOPE

It is the objective of this document for the Arizona Department of Transportation (ADOT) to define the Quality Assurance requirements for any Local Public Agency (LPA) that has been granted Certification Acceptance (CA) status to administer Federal-Aid construction projects. The LPA Quality Assurance requirements described herein have been developed by ADOT Materials Group, Quality Assurance Section to provide consistent implementation and supporting documentation in accordance with the Code of Federal Regulations (23 CFR 637, Subpart B), *"Quality Assurance Procedures for Construction"* (See **Appendix D**). Appendix A has been developed with the understanding that significant portions of the Phoenix and Tucson metropolitan areas will be designated as part of the National Highway System (NHS) under Federal Authorization MAP-21.

The LPA Quality Assurance process is composed of the following main components:

- Qualification of Testing Personnel
- Qualification of Laboratories
- Pre-Construction Approval by ADOT of the LPA Materials Sampling and Testing Plan
- Acceptance Samping and Testing
- Independent Assurance (I.A.) Sampling and Testing
- Certificates of Compliance and Certificates of Analysis
- Buy America Requirements for Steel and Iron Products
- Final Certification of Materials
- Records Retention and Audit Requirements

To determine compliance with applicable regulations, the contractual relationship between the acceptance laboratory, sampling/testing personnel, contractor, and LPA must be clearly defined.

A2. LIST OF ABBREVIATIONS

AAP	AASHTO Accreditation Program
AASHTO	American Association of State Highway and Transportation Officials
ACI	American Concrete Institute
ADOT	Arizona Department of Transportation
ΑΤΤΙ	Arizona Technical Testing Institute
CA	Certification Acceptance
CFR	Code of Federal Regulations
I.A.	Independent Assurance Sampling and Testing Program
LPA	Local Public Agency
MAP-21	"Moving Ahead for Progress in the 21st Century" Act
NHS	National Highway System

A4. QUALIFICATION OF SAMPLING AND TESTING PERSONNEL

All field and laboratory personnel performing sampling or testing of construction materials on a LPA construction project must have the certifications shown in **Figure A1**, as applicable for the scope of the project.

Soils and Aggregate							
Field	Laboratory						
Arizona Technical Testing Institute (ATTI) "Field" certification.	Arizona Technical Testing Institute (ATTI) "Laboratory Soils/Aggregate" certification.						
Asphaltic	Asphaltic Concrete						
Field	Laboratory						
Arizona Technical Testing Institute (ATTI) "Field" certification.	Arizona Technical Testing Institute (ATTI) "Asphalt" certification.						
Con	crete						
Field	Laboratory						
American Concrete Institute (ACI) "Concrete Field Testing Technician Grade I" certification.	American Concrete Institute (ACI) "Concrete Strength Testing Technician" certification.						

REQUIREMENTS FOR SAMPLING AND TESTING TECHNICIANS

Figure A1

A5. QUALIFICATION OF LABORATORIES

ADOT recognizes the AASHTO Accreditation Program (AAP) in conjunction with AASHTO R 18, *"Establishing and Implementing a Quality Management System for Construction Materials Laboratories"*, for a laboratory to demonstrate competency in the performance of specific tests on construction materials. All laboratories that perform construction materials testing on LPA construction projects must be AAP accredited in the testing procedures performed.

A6. PRE-CONSTRUCTION APPROVAL OF THE LPA MATERIALS SAMPLING AND TESTING PLAN

The LPA will submit the following documents to the ADOT Materials Group, Quality Assurance Engineer for approval prior to beginning construction:

1. Bid Schedule that shows the Item Number, Item Description, Unit, and Quantity of project construction materials and activities. **Figure A2** shows an example Bid Schedule.

2. Materials Sample Checklist that details the scope of the proposed sampling and testing. The materials that are to be sampled and tested, as well as the frequency at which the sampling and testing are to be performed, is to be shown on the Materials Sample Checklist. **Figure A3** shows an example Materials Sample Checklist.

3. Materials Certificate Log that lists Certificates of Compliance and Certificates of Analysis that will be required during construction. An example Materials Certificate Log is shown in **Figure A4**.

4. Statement that details the contractual relationship between the acceptance laboratory, independent assurance laboratory, field sampling/testing personnel, contractor, and the LPA. If the acceptance laboratory or the independent assurance laboratory receives payment from the contractor, that relationship must be clearly defined.

A flow chart showing the process listed above is given in **Figure A5**.

A7. ACCEPTANCE SAMPLING AND TESTING

Acceptance Sampling and Testing is separate from Independent Assurance Sampling and Testing.

It is the responsibility of the Local Public Agency to develop a Sampling Guide which outlines the requirements for Acceptance Sampling and Testing. The guide shall be submitted to the ADOT Materials Quality Assurance Engineer for review and approval.

An LPA Central Laboratory may perform both Acceptance Sampling and Testing and Independent Assurance Sampling and Testing on a particular project. However, the same individual shall not perform both the Acceptance Sampling and Testing and the Independent Assurance Sampling and Testing.

A laboratory other than an LPA Central Laboratory shall not perform both Acceptance Sampling and Testing and Independent Assurance Sampling and Testing on a particular project.

PRE-CONSTRUCTION APPROVAL OF THE LPA MATERIALS SAMPLING AND TESTING PLAN FLOW CHART

Figure A5

Acceptance Sampling and Testing may be performed by:

- Local Public Agency sampling and testing personnel.
- An independent consultant laboratory selected and compensated by the Local Public Agency.
- Contractor sampling and testing personnel.
- An independent consultant laboratory selected and compensated by the contractor.

A8. INDEPENDENT ASSURANCE (I.A.) SAMPLING AND TESTING

Independent Assurance Sampling and Testing is separate from Acceptance Sampling and Testing.

The LPA is responsible for administering the Independent Assurance Sampling and Testing.

An LPA Central Laboratory may perform both Independent Assurance Sampling and Testing and Acceptance Sampling and Testing on a particular project. However, the same individual shall not perform both the Independent Assurance Sampling and Testing and the Acceptance Sampling and Testing.

A laboratory other than an LPA Central Laboratory shall not perform both Independent Assurance Sampling and Testing and Acceptance Sampling and Testing on a particular project.

Independent assurance samples shall be obtained from project or processing facility by the LPA or by an independent consultant laboratory selected and compensated by the LPA.

If the acceptance testing is performed by the LPA, or an independent consultant laboratory which is selected and compensated by the LPA, the ratio of independent assurance sampling and testing is one I.A. per 20 acceptance tests.

If the acceptance testing is performed by the contractor, or an independent consultant laboratory which is selected and compensated by the contractor, the ratio of independent assurance sampling and testing is one I.A. per 5 acceptance tests.

Note: The increased frequency of I.A. sampling and testing when acceptance sampling and testing is performed by the contractor, or an independent consultant laboratory which is selected and compensated by the contractor, is utilized as verification of the contractor's acceptance testing.

When an LPA Central Laboratory does not perform both the independent assurance testing and the acceptance testing, each I.A. field sample shall be split between the laboratory performing the independent assurance testing and the laboratory performing the acceptance testing.

If the test results do not compare favorably, cooperative efforts to investigate and identify the cause of the discrepancy should commence immediately. As a minimum, these efforts should include a check of the test data, calculations, and results; an inspection of the equipment used to perform the testing; a discussion with the test operators regarding their knowledge of the procedure in question; retesting of samples; exchanging samples; and observation of each other's techniques. When the problem is isolated, the steps taken to resolve it shall be documented.

A9. CERTIFICATES OF COMPLIANCE AND CERTIFICATES OF ANALYSIS

Manufactured products that are accepted by the LPA through a Certificate of Compliance or Certificate of Analysis shall include, as a minimum:

- The current name, address, and phone number of the manufacturer or supplier of the material.
- A description of the material supplied.
- Quantity of material represented by the certificate.
- Means of material identification, such as label, lot number, or marking.
- A statement that the material complies in all respects with the requirements of the cited specifications.
- The name, title, and signature an individual has the legal authority to bind the manufacturer or the supplier of the material. The date of the signature shall also be given. In addition, a statement that the individual has such legal authority.

A10. BUY AMERICA REQUIREMENTS FOR STEEL AND IRON PRODUCTS

Steel and iron materials and products used shall comply with the current "Buy America" requirements of 23 CFR 635.410.

All steel and iron products permanently incorporated into a LPA project must be domestically produced and have appropriate certification statements provided by the manufacturer. Records for the steel and iron products must be traceable through heat numbers and mill certificates. Certification statements should be verified by visual inspection at the time of material delivery to the project site.

A11. FINAL CERTIFICATION OF MATERIALS

Following completion of the project construction, the LPA shall submit copies of the Testing Summaries and the Materials Certification/Exception Report to the Materials Group, Quality Assurance Engineer. The copies shall be submitted electronically in "pdf" format. The Materials Quality Assurance Engineer will review these items, and if necessary notify the LPA Project Engineer of any deficiencies that require correction. A flow chart illustrating this process is shown in **Figure A7**.

A11.1 Submittal of Testing Summaries

The LPA shall submit copies of the project testing summaries to the ADOT Materials Group, Quality Assurance Engineer. As a minimum, the testing summaries must include the following:

1. Name of laboratory and technician that performed the testing, and the date the testing was performed.

2. Summary of test results. The summary shall include a comprehensive report of all test results.

A11.2 Exception Reporting Requirement

The materials records for each project shall be reviewed by the LPA Project Engineer. A "Materials Certification / Exception Report" shall then be prepared by the LPA Project Engineer. The Materials Certification / Exception Report must include at a minimum the following statement:

> "I certify that I have reviewed the materials records for the above referenced project. The results of the tests used in the acceptance program indicate that the materials incorporated in the construction work, and the construction operations controlled by sampling and testing, were in conformity with the approved plans and specifications. In addition, all material sampling and testing was performed in accordance with the Approved LPA Materials Sampling and Testing Plan."

Construction materials that failed to meet specification requirements, but were incorporated in the project, must be summarized in the Materials Certification/Exception Report with a detailed explanation listing penalties or justification for acceptance.

An example Materials Certification / Exception Report is given in Figure A6.

The Materials Certification / Exception Report shall be submitted to the Materials Group, Quality Assurance Engineer under seal of a professional engineer registered the State of Arizona.

A12. RECORDS RETENTION AND AUDIT REQUIREMENTS

The LPA shall maintain all test reports, certificates, and test summaries for a minimum of five years after the project has been completed. All records shall be available for review by ADOT at any time while the project is in construction or during the five year retention period.

(Local Public Agency Letterhead)

(Date)

- TO: (Name) Quality Assurance Engineer ADOT Materials Group 1221 N. 21st Avenue Phoenix, AZ 85009
- FROM: Name of Project Engineer (LPA Name)
- RE: MATERIALS CERTIFICATION/EXCEPTION REPORT
- PROJECT: (Project Name from the plans and specifications) (TRACS Number) (Federal ID Number)

I certify that I have reviewed the materials reports for the above referenced project. The results of the tests used in the acceptance program indicate that the materials incorporated in the construction work, and the construction operations controlled by sampling and testing were in conformity with the approved plans and specifications. In addition, all materials sampling and testing was performed in accordance with the Approved LPA Materials Sampling and Testing Plan. Exceptions to the above certification are as follows:

1. List any materials that were incorporated in the completed construction project where testing indicated non-conformance to the plans and specifications. If Materials Quality penalties were imposed or contract change orders associated with Material Quality were initiated, list the specific details of those agreements.

2. List any item that were not sampled and testing as indicated in the Approved LPA Materials Sampling and Testing Plan and provide details on how the LPA plans to prevent recurrence of the sampling and testing deficiencies on future projects.

APPENDIX B

FINAL CERTIFICATION OF MATERIALS FOR CONSULTANT ADMINISTERED PROJECTS

This page intentionally left blank.

APPENDIX B

Final Certification of Materials for Consultant Administered Projects

B1. The final certification of materials for consultant administered projects will be conducted as follows:

B1.1 The consultant engineer will be responsible for sampling and testing materials in accordance with the ADOT Materials Testing Manual and the Specifications.

B1.2 Independent Assurance Sampling and Testing and Correlation Testing will be performed by the ADOT Regional Lab as the work progresses.

B1.3 Independent Assurance and Correlation samples taken by ADOT personnel, as outlined in item (b) above do not relieve the consultant engineer of the responsibility for sampling and testing of materials in accordance with **Section B1.1** above.

B1.4 At the completion of the project, the consultant engineer will complete the Materials Sample Checklist, Materials Certificate Log, and Materials Certification / Exception Report, as detailed in **Sections (V)(E)(1) through (V)(E)(3)**. These documents will be submitted to the ADOT Project Monitor for review. If necessary, the documents will be returned to the consultant engineer for correction. Upon approval by the ADOT Project Monitor, the documents will be forwarded to the Regional Materials Engineer for review.

B1.5 The Regional Materials Engineer and District Engineer will prepare the Final Materials Certification as outlined in **Section (V)(E)(4)**. The Final Materials Certification, including attachments (Materials Sample Checklist, Materials Certificate Log, and Materials Certification / Exception Report), shall be sent to the Assistant State Engineer, Materials Group.

B1.6 For Federal-Aid projects, the Assistant State Engineer, Materials Group, will review the documentation furnished by the District Engineer. Based on this documentation, the Assistant State Engineer, Materials Group, will prepare and submit a certification letter to the Federal Highway Administration. Accompanying that certification letter will be a copy of the Materials Certification / Exception Report. A copy of the certification letter and supporting documentation will be maintained on file by the Materials Group Quality Assurance Section.

B1.7 For Non Federal-Aid projects, the Materials Group, Quality Assurance Section, will review the documentation furnished by the District Engineer. Based on this documentation, the Materials Group, Quality Assurance Section, will prepare a certification letter. The certification letter and supporting documentation will be maintained on file by the Materials Group Quality Assurance Section.

SPECIFI- CATION SECTION	MATERIAL	TYPE OF TEST(S) REQUIRED	SAMPLING POINT	MINIMUM SAMPLING FREQUENCY
501	Corrugated Metal Pipe (CMP) [Coated or Non-coated]	Yearly check by Central Lab	Supplier's Yard	Certificate of Compliance required.
501 1006	Non- Reinforced, Cast-in-Place Concrete Pipe	Compressive Strength Slump Air Content (when required) Temperature Wall	At Discharge ⁽⁶⁾ Site	Per Specifications.
501	Precast	Thickness	Supplier's	Certificate of Compliance
1010	Reinforced or Non- Reinforced Concrete Pipe	(D-Load) Wall Thickness	Yard	required and one sample for each 100 sections per size per type.
Refer to Special Provisions	Vitrified Clay Pipe	Compression	Project	One sample for each 100 sections per size per type.
505	Brick for Manholes	Compression	Project	One sample (3 bricks) per project.
⁽⁶⁾ If concre	te is pumped to fac	cilitate placement,	at the discretion	n of the Engineer,

(b) If concrete is pumped to facilitate placement, at the discretion of the Engineer, samples may be taken from the truck and pump hose discharge to determine that the compressive strength specifications are met in the structure, and to correlate temperature, slump, and air content results. If the correlation is satisfactory and meets with the approval of the Engineer, sampling may continue from the most convenient location with occasional retesting for correlation. Rejection of concrete due to improper temperature or slump may occur at either the truck or pump hose discharge; however, rejection of concrete due to improper air content will only occur due to a failing test for a sample obtained at the final point of discharge.

APPENDIX D

CODE OF FEDERAL REGULATIONS

23 CFR 637, SUBPART B "QUALITY ASSURANCE PROCEDURES FOR CONSTRUCTION"

This page intentionally left blank.

CODE OF FEDERAL REGULATIONS

23 CFR 637, Subpart B

"Quality Assurance Procedures for Construction"

April 1, 2013

§637.201 Purpose.

To prescribe policies, procedures, and guidelines to assure the quality of materials and construction in all Federal-aid highway projects on the National Highway System.

§637.203 Definitions.

Acceptance program. All factors that comprise the State transportation department's (STD) determination of the quality of the product as specified in the contract requirements. These factors include verification sampling, testing, and inspection and may include results of quality control sampling and testing.

Independent assurance program. Activities that are an unbiased and independent evaluation of all the sampling and testing procedures used in the acceptance program. Test procedures used in the acceptance program which are performed in the STD's central laboratory would not be covered by an independent assurance program.

Proficiency samples. Homogeneous samples that are distributed and tested by two or more laboratories. The test results are compared to assure that the laboratories are obtaining the same results.

Qualified laboratories. Laboratories that are capable as defined by appropriate programs established by each STD. As a minimum, the qualification program shall include provisions for checking test equipment and the laboratory shall keep records of calibration checks.

Qualified sampling and testing personnel. Personnel who are capable as defined by appropriate programs established by each STD.

Quality assurance. All those planned and systematic actions necessary to provide confidence that a product or service will satisfy given requirements for quality.

Quality control. All contractor/vendor operational techniques and activities that are performed or conducted to fulfill the contract requirements.

Random sample. A sample drawn from a lot in which each increment in the lot has an equal probability of being chosen.

Vendor. A supplier of project-produced material that is not the contractor.

Verification sampling and testing. Sampling and testing performed to validate the quality of the product.

§637.205 Policy.

(a) *Quality assurance program.* Each STD shall develop a quality assurance program which will assure that the materials and workmanship incorporated into each Federal-aid highway construction project on the NHS are in conformity with the requirements of the approved plans and specifications, including approved changes. The program must meet the criteria in §637.207 and be approved by the FHWA.

(b) *STD capabilities.* The STD shall maintain an adequate, qualified staff to administer its quality assurance program. The State shall also maintain a central laboratory. The State's central laboratory shall meet the requirements in §637.209(a)(2).

(c) *Independent assurance program.* Independent assurance samples and tests or other procedures shall be performed by qualified sampling and testing personnel employed by the STD or its designated agent.

(d) *Verification sampling and testing.* The verification sampling and testing are to be performed by qualified testing personnel employed by the STD or its designated agent, excluding the contractor and vendor.

(e) *Random samples.* All samples used for quality control and verification sampling and testing shall be random samples.

§637.207 Quality assurance program.

(a) Each STD's quality assurance program shall provide for an acceptance program and an independent assurance (IA) program consisting of the following:

(1) Acceptance program.

(i) Each STD's acceptance program shall consist of the following:

(A) Frequency guide schedules for verification sampling and testing which will give general guidance to personnel responsible for the program and allow adaptation to specific project conditions and needs.

(B) Identification of the specific location in the construction or production operation at which verification sampling and testing is to be accomplished.

(C) Identification of the specific attributes to be inspected which reflect the quality of the finished product.

(ii) Quality control sampling and testing results may be used as part of the acceptance decision provided that:

(A) The sampling and testing has been performed by qualified laboratories and qualified sampling and testing personnel.

(B) The quality of the material has been validated by the verification sampling and testing. The verification testing shall be performed on samples that are taken independently of the quality control samples.

(C) The quality control sampling and testing is evaluated by an

IA program.

(iii) If the results from the quality control sampling and testing are used in the acceptance program, the STD shall establish a dispute resolution system. The dispute resolution system shall address the resolution of discrepancies occurring between the verification sampling and testing and the quality control sampling and testing. The dispute resolution system may be administered entirely within the STD.

(iv) In the case of a design-build project on the National Highway System, warranties may be used where appropriate. See 23 CFR 635.413(e) for specific requirements.

(2) The IA program shall evaluate the qualified sampling and testing personnel and the testing equipment. The program shall cover sampling procedures, testing procedures, and testing equipment. Each IA program shall include a schedule of frequency for IA evaluation. The schedule may be established based on either a project basis or a system basis. The frequency can be based on either a unit of production or on a unit of time.

(i) The testing equipment shall be evaluated by using one or more of the following: Calibration checks, split samples, or proficiency samples.

(ii) Testing personnel shall be evaluated by observations and split samples or proficiency samples.

(iii) A prompt comparison and documentation shall be made of test results obtained by the tester being evaluated and the IA tester. The STD shall develop guidelines including tolerance limits for the comparison of test results. (iv) If the STD uses the system approach to the IA program, the STD shall provide an annual report to the FHWA summarizing the results of the IA program.

(3) The preparation of a materials certification, conforming in substance to Appendix A of this subpart, shall be submitted to the FHWA Division Administrator for each construction project which is subject to FHWA construction oversight activities.

(b) In the case of a design-build project funded under title 23, U.S. Code, the STD's quality assurance program should consider the specific contractual needs of the design-build project. All provisions of paragraph (a) of this section are applicable to design-build projects. In addition, the quality assurance program may include the following:

(1) Reliance on a combination of contractual provisions and acceptance methods;

(2) Reliance on quality control sampling and testing as part of the acceptance decision, provided that adequate verification of the design-builder's quality control sampling and testing is performed to ensure that the design-builder is providing the quality of materials and construction required by the contract documents.

(3) Contractual provisions which require the operation of the completed facility for a specific time period.

[60 FR 33717, June 29, 1995, as amended at 67 FR 75934, Dec. 10, 2002]

§637.209 Laboratory and sampling and testing personnel qualifications.

(a) Laboratories.

(1) After June 29, 2000, all contractor, vendor, and STD testing used in the acceptance decision shall be performed by qualified laboratories.

(2) After June 30, 1997, each STD shall have its central laboratory accredited by the AASHTO Accreditation Program or a comparable laboratory accreditation program approved by the FHWA.

(3) After June 29, 2000, any non-STD designated laboratory which performs IA sampling and testing shall be accredited in the testing to be performed by the AASHTO Accreditation Program or a comparable laboratory accreditation program approved by the FHWA.

(4) After June 29, 2000, any non-STD laboratory that is used in dispute resolution sampling and testing shall be accredited in the testing to be performed by the AASHTO Accreditation Program or a comparable laboratory accreditation program approved by the FHWA.

(5) After September 24, 2009, laboratories that perform crash testing for acceptance of roadside hardware by the FHWA shall be accredited by a laboratory accreditation body that is recognized by the National Cooperation for Laboratory Accreditation (NACLA), is a signatory to the Asia Pacific Laboratory Accreditation Cooperation (APLAC) Mutual Recognition Arrangement (MRA), is a signatory to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA), or another accreditation body acceptable to FHWA.

(b) Sampling and testing personnel. After June 29, 2000, all sampling and testing data to be used in the acceptance decision or the IA program shall be executed by qualified sampling and testing personnel.

(c) Conflict of interest. In order to avoid an appearance of a conflict of interest, any qualified non-STD laboratory shall perform only one of the following types of testing on the same project: Verification testing, quality control testing, IA testing, or dispute resolution testing.

[60 FR 33717, June 29, 1995, as amended at 72 FR 54212, Sept. 24, 2007]

Appendix A to Subpart B of Part 637—Guide Letter of Certification by State Engineer

Date _____ Project No. _____

This is to certify that:

The results of the tests used in the acceptance program indicate that the materials incorporated in the construction work, and the construction operations controlled by sampling and testing, were in conformity with the approved plans and specifications. (The following sentence should be added if the IA testing frequencies are based on project quantities. All independent assurance samples and tests are within tolerance limits of the samples and tests that are used in the acceptance program.)

Exceptions to the plans and specifications are explained on the back hereof (or on attached sheet).

Director of STD Laboratory or other appropriate STD Official.
