

Measurement System Analysis (MSA) Using MINITAB

To reduce the total variation 'Measurement Variation' should be identified.

$$\sigma_{total}^2 = \sigma_{product}^2 + \sigma_{measurement\ system}^2$$

Gage R&R Evaluating

Type of measurement system variation : Width or Spread

- **Repeatability** : is the variation in measurements obtained with one measurement instrument when used several times by an appraiser while measuring the identical characteristic on the same part / condition.
- **Reproducibility** : is the variation in the average of the measurements made by different appraisers using the same measurement instrument when measure the identical characteristic on the same part / condition.

Type of Data

- **Discrete (attribute) Data** : Qualitative data that can be counted and recorded to analysis.. Example, a shaft diameter measured by Go-no go gage.

X = Good or No Good,

X = Pass or Fail

- **Variable / Continuous data** : Quantitative data measured by measurement system.. Example, height or weight of student.

X = 150, 160, 170 cm,

X = 60, 65, 70 kg

Case Study

Scenario :

There was an issue feedback from HDD manufacturing plant in Singapore. Drives were facing HSA hit top cover. The FA reported that all units got cartridge height problem.

Possible Root Causes: Correlation, Cartridge installation or Both?

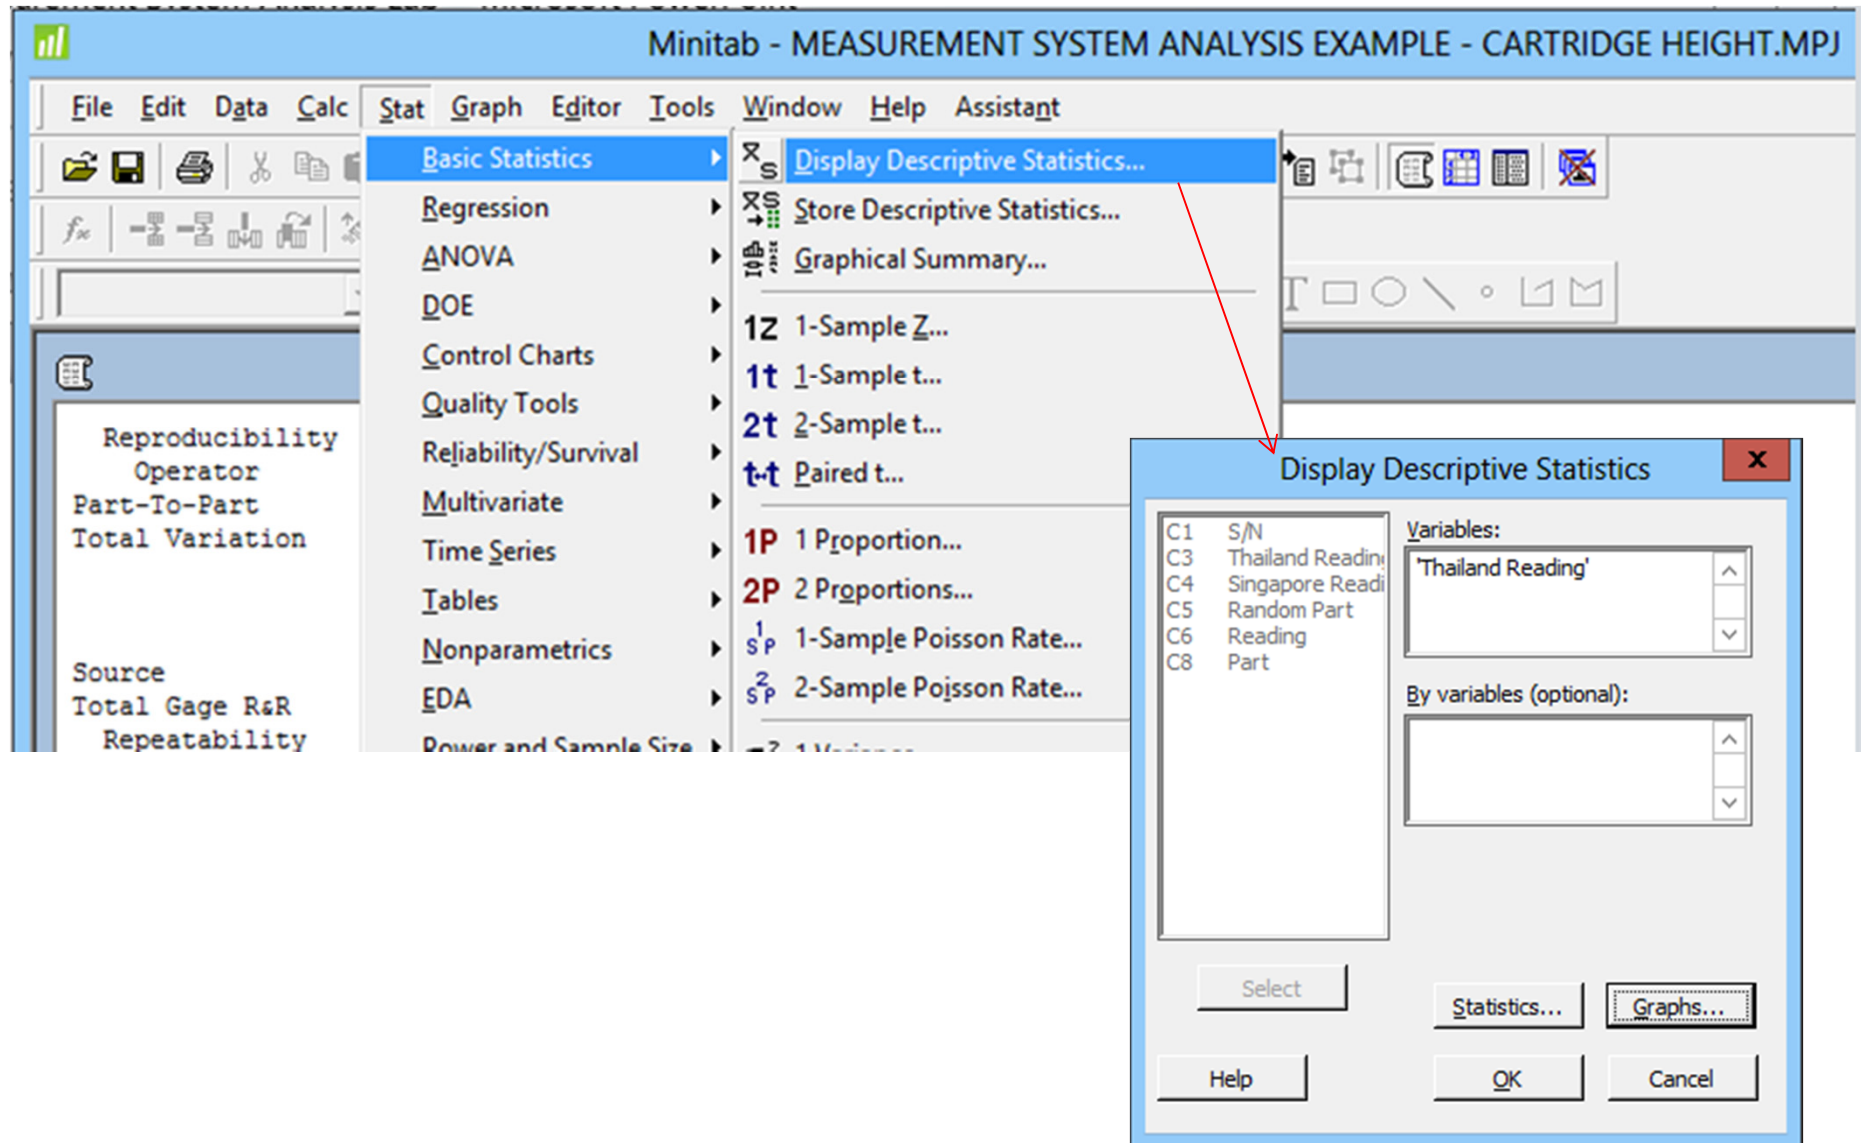

10 cartridges were randomly selected from assembly lines at SG plant. Cartridge heights were measured by 3 different tools (A, B and C) each measured 3 times then sent back to Thailand for investigation

Thailand Action Items :

1. MSA needed → Gauge R&R both TH and SG plants
2. Test Hypothesis → Paired T-test
3. Correlation → Linear Regression Analysis

Basic Information about the Data

Open MINITAB File “MEASUREMENT SYSTEM ANALYSIS EXAMPLE - CARTRIDGE HEIGHT.MPJ”

Basic Information about the Data

Descriptive Statistics: Thailand Reading

| | | | | | | | | |
|------------------|----|--------|---------|---------|-------|---------|--------|--------|
| Variable | N | N* | Mean | SE Mean | StDev | Minimum | Q1 | Median |
| Thailand Reading | 90 | 0 | 15.097 | 0.128 | 1.210 | 13.762 | 14.118 | 14.681 |
| Variable | | Q3 | Maximum | | | | | |
| Thailand Reading | | 15.574 | 17.423 | | | | | |

Descriptive Statistics: Singapore Reading

| | | | | | | | | |
|-------------------|----|--------|---------|---------|-------|---------|--------|--------|
| Variable | N | N* | Mean | SE Mean | StDev | Minimum | Q1 | Median |
| Singapore Reading | 90 | 0 | 15.289 | 0.125 | 1.185 | 13.930 | 14.314 | 14.899 |
| Variable | | Q3 | Maximum | | | | | |
| Singapore Reading | | 15.756 | 17.633 | | | | | |

Normality Test of Data

Most of the statistical tools, except for non-parametric test, require that the data distribute normally. So before we can use these tools, the normality of data must be validated.

10 parts were randomly selected and cartridge height data were already available for Normality Test.

| Source | DF | SS | MS | |
|----------------|----|---------|---------|------|
| S/N | 9 | 124.177 | 13.7975 | 1573 |
| Operator | 2 | 0.004 | 0.0018 | 0 |
| S/N * Operator | 18 | 0.158 | 0.0088 | 0 |
| Repeatability | 60 | 0.599 | 0.0100 | |
| Total | 89 | 124.938 | | |

These two data points are likely outliers (the rare and extreme). They can be discarded and replaced with new samples.

Ideally, all data points should lie on the straight line, if they were distributed normally. In practice, due to random nature of the data, they will not.

We then test the hypothesis of normality of data by looking at the P-value. The null hypothesis is “data distribute normally”. Typically, If the P-value is less than 5% we can reject the null hypothesis.

In this case the null hypothesis cannot be rejected and we can say that “the data probably distribute normally”.

If the P-value is less than 5%, we can discard a few samples, recollect and test again until pass.

Action 1: Gauge R&R

Open MINITAB File “MEASUREMENT SYSTEM ANALYSIS EXAMPLE - CARTRIDGE HEIGHT.MPJ”

The screenshot shows the Minitab software interface with the 'Stat' menu open. The 'Quality Tools' submenu is expanded, and the 'Gage Study' option is selected. A secondary menu is displayed, showing 'Gage R&R Study (Crossed)...' as the chosen option. The 'Gage R&R Study (Crossed)' dialog box is open, showing the following settings:

- Part numbers: 'S/N'
- Operators: 'Operator'
- Measurement data: 'Thailand Reading'
- Method of Analysis: ☒ ANOVA, ☐ Xbar and R

Buttons in the dialog include 'Gage Info...', 'Options...', 'Conf Int...', 'Storage...', 'Select', 'Help', 'OK', and 'Cancel'. A red arrow points from the 'Gage R&R Study (Crossed)...' option in the secondary menu to the 'Gage R&R Study (Crossed)' dialog box.

At the bottom of the screenshot, a portion of the data table is visible, titled 'MEASUREMENT SYSTEM ANALYSIS EXAMPLE - CARTRIDGE HEIGHT.MPJ'.

| | C1 | C2-T | C3 | C4 | C5 | C6 | C7-T | C8 | C9 | C10 | C |

| Part-To-Part | 1.23773 | 7.42638 | 99.68 |
| Total Variation | 1.24164 | 7.44986 | 100.00 |

The residual error must distribute normally: $e = \text{NID}(0, \sigma^2)$

Gage R&R Combined (to see the effects of measurement locations)

Two-Way ANOVA Table Without Interaction

| Source | DF | SS | MS | F | P |
|---------------|-----|---------|---------|---------|-------|
| Part | 9 | 253.681 | 28.1867 | 3097.44 | 0.000 |
| Tester | 1 | 1.662 | 1.6623 | 182.67 | 0.000 |
| Repeatability | 169 | 1.538 | 0.0091 | | |
| Total | 179 | 256.881 | | | |

Gage R&R

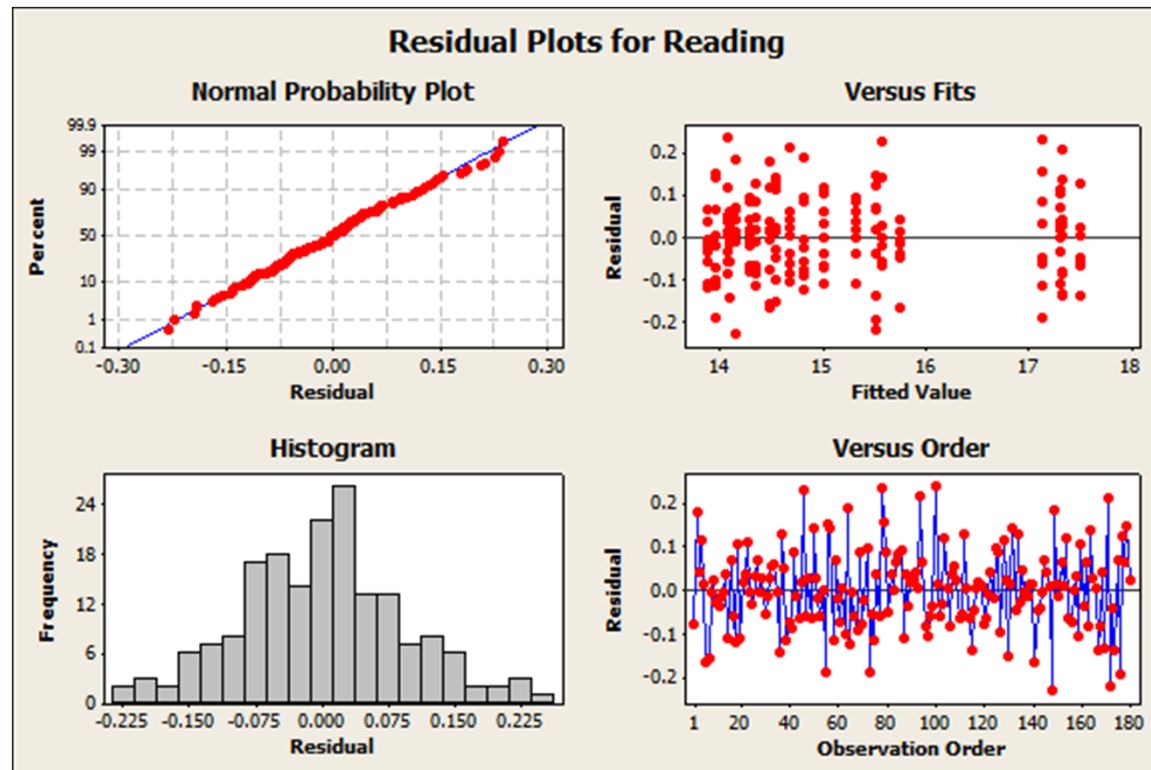

| Source | VarComp | %Contribution (of VarComp) |
|-----------------|---------|-------------------------------|
| Total Gage R&R | 0.02747 | 1.72 |
| Repeatability | 0.00910 | 0.57 |
| Reproducibility | 0.01837 | 1.15 |
| Tester | 0.01837 | 1.15 |
| Part-To-Part | 1.56542 | 98.28 |
| Total Variation | 1.59289 | 100.00 |

Now we can see that plant measurements differ significantly, statistically speaking.

The reading differences between TH&SG plants (1.15%) is statistically significant (P-value = 0.000 above) which need to be investigated further.

| Source | StdDev (SD) | Study Var (6 * SD) | %Study Var (%SV) |
|-----------------|-------------|-----------------------|---------------------|
| Total Gage R&R | 0.16574 | 0.99443 | 13.13 |
| Repeatability | 0.09539 | 0.57236 | 7.56 |
| Reproducibility | 0.13553 | 0.81320 | 10.74 |
| Tester | 0.13553 | 0.81320 | 10.74 |
| Part-To-Part | 1.25117 | 7.50702 | 99.13 |
| Total Variation | 1.26210 | 7.57259 | 100.00 |

The residual error must distribute normally: $e = \text{NID}(0, \sigma^2)$

Action 2: Test of Hypothesis

Test Hypothesis is required to check both Mean and Variation.

Remark : We are using the exactly same parts for both Thailand and Singapore.

This allows us to use the paired T-test technique for hypothesis testing. This technique is much less sensitive to part-to-part variation than the T-test and Z-test.

Note that the paired T-test requires data be distributed normally and collected (or measured) in pair.

Hypothesis Test of Equal Variances

Referring to the basic info of data, we can see that it is likely that the variances of both data sets are the same. If this is true, we can use pooled variance for subsequent analysis.

Basic Information about the Data

Descriptive Statistics: Thailand Reading

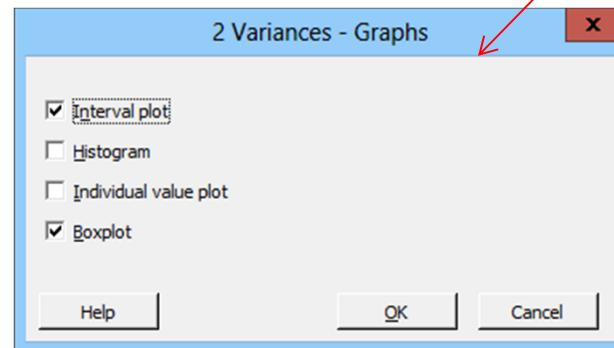

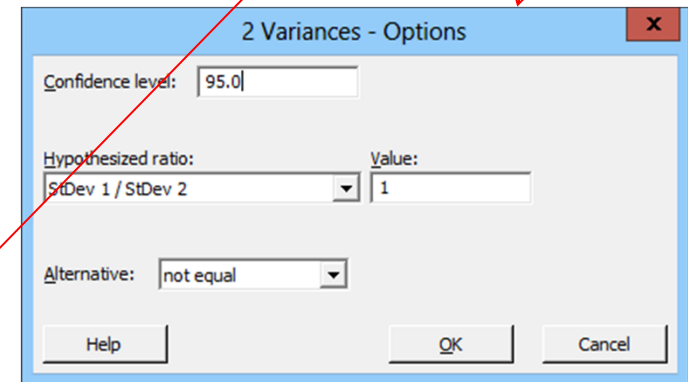

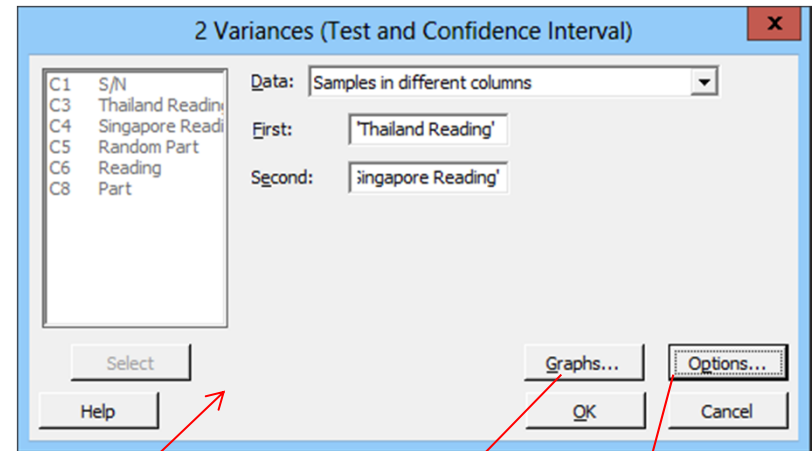

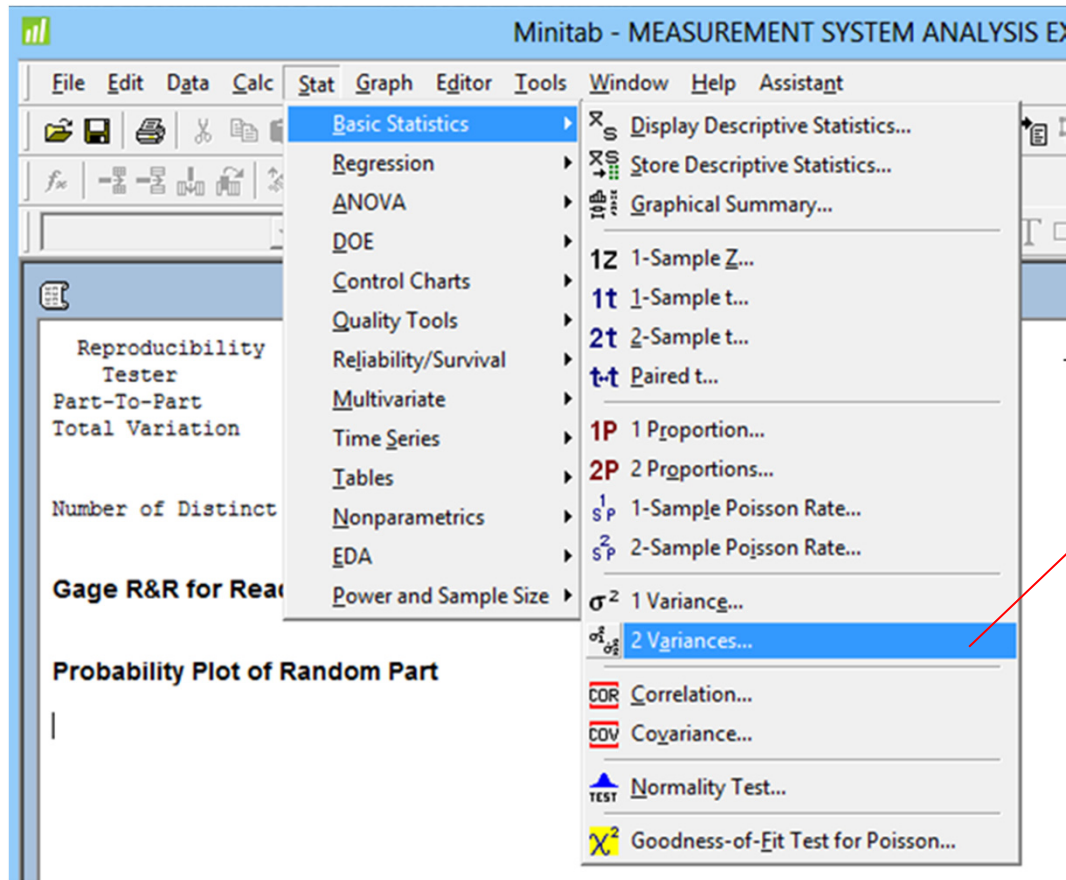

| Variable | N | N* | Mean | SE Mean | StDev | Minimum | Q1 | Median |
|------------------|----|----|--------|---------|-------|---------|--------|--------|
| Thailand Reading | 90 | 0 | 15.097 | 0.128 | 1.210 | 13.762 | 14.118 | 14.681 |

| Variable | Q3 | Maximum |
|------------------|--------|---------|
| Thailand Reading | 15.574 | 17.423 |

Descriptive Statistics: Singapore Reading

| Variable | N | N* | Mean | SE Mean | StDev | Minimum | Q1 | Median |
|-------------------|----|----|--------|---------|-------|---------|--------|--------|
| Singapore Reading | 90 | 0 | 15.289 | 0.125 | 1.185 | 13.930 | 14.314 | 14.899 |

| Variable | Q3 | Maximum |
|-------------------|--------|---------|
| Singapore Reading | 15.756 | 17.633 |

Test and CI for Two Variances: Thailand Reading, Singapore Reading

Method

Null hypothesis $\text{Sigma}(\text{Thailand Reading}) / \text{Sigma}(\text{Singapore Reading}) = 1$
Alternative hypothesis $\text{Sigma}(\text{Thailand Reading}) / \text{Sigma}(\text{Singapore Reading}) \text{ not } = 1$
Significance level $\text{Alpha} = 0.05$

Statistics

| Variable | N | StDev | Variance |
|-------------------|----|-------|----------|
| Thailand Reading | 90 | 1.210 | 1.464 |
| Singapore Reading | 90 | 1.185 | 1.404 |

Ratio of standard deviations = 1.021
Ratio of variances = 1.043

95% Confidence Intervals

| Distribution of Data | CI for StDev Ratio | CI for Variance Ratio |
|----------------------|--------------------|-----------------------|
| Normal | (0.828, 1.259) | (0.686, 1.584) |
| Continuous | (0.787, 1.348) | (0.620, 1.817) |

This said "variances could be equal".

Tests

| Method | DF1 | DF2 | Test Statistic | P-Value |
|--------------------------------|-----|-----|----------------|---------|
| F Test (normal) | 89 | 89 | 1.04 | 0.844 |
| Levene's Test (any continuous) | 1 | 178 | 0.05 | 0.827 |

This said "the null hypothesis H_0 (equal variance) cannot be rejected at 5% risk". The risk of being wrong is 84.4% to reject it.

Paired T-Test and CI: Thailand Reading, Singapore Reading

Paired T for Thailand Reading - Singapore Reading

| | N | Mean | StDev | SE Mean |
|-------------------|----|---------|--------|---------|
| Thailand Reading | 90 | 15.097 | 1.210 | 0.128 |
| Singapore Reading | 90 | 15.289 | 1.185 | 0.125 |
| Difference | 90 | -0.1922 | 0.1267 | 0.0134 |

This said “we can reject the null hypothesis H_0 (equal reading) at 5% risk”.

95% CI for mean difference: (-0.2187, -0.1657)

T-Test of mean difference = 0 (vs not = 0): T-Value = -14.39 P-Value = 0.000

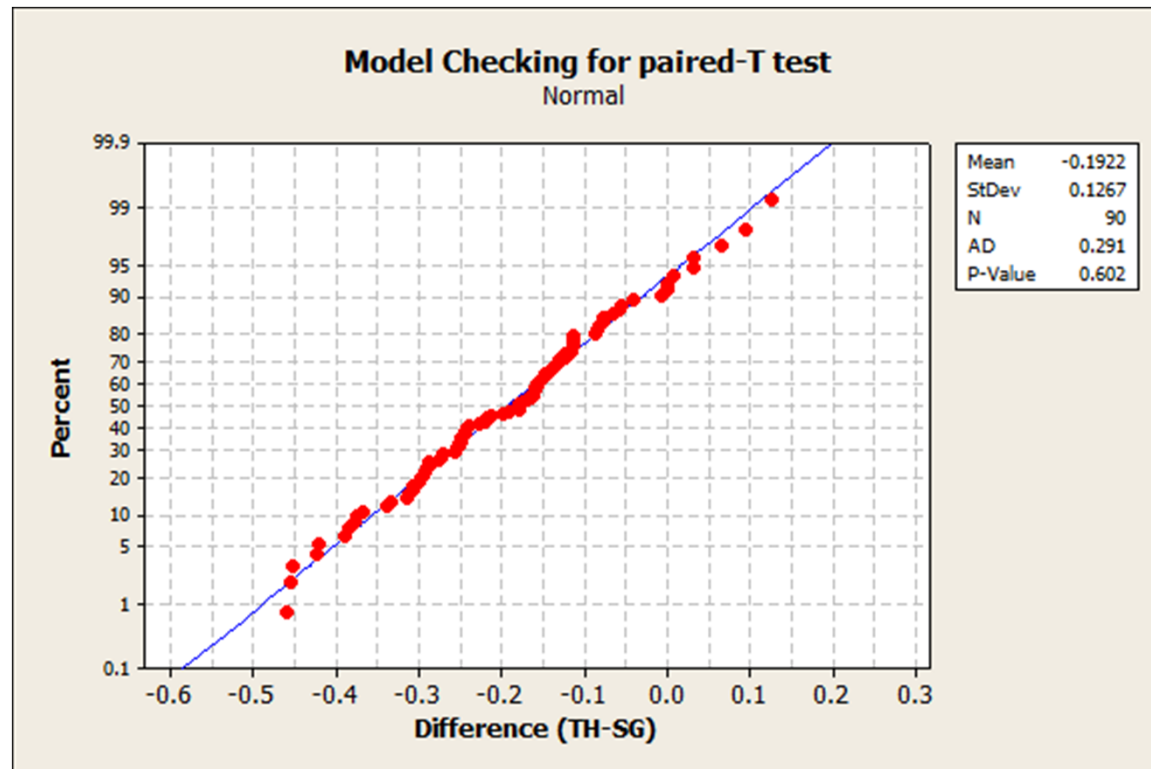

This said “the mean readings of cartridge heights between TH & SG plants is likely to be different, 95% confident”.

Conclusion may be something like this:

“It is 95% confident that TH measures cartridge heights lower than SG by 0.1922 on average”. This helps explain why some HSA hit top cover at SG plant.

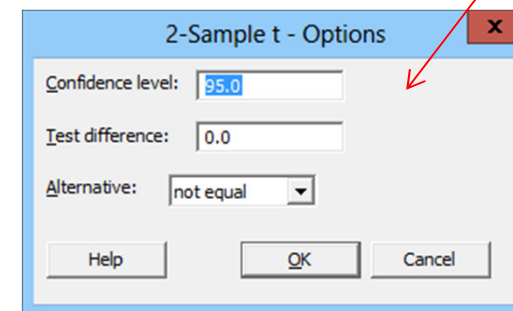

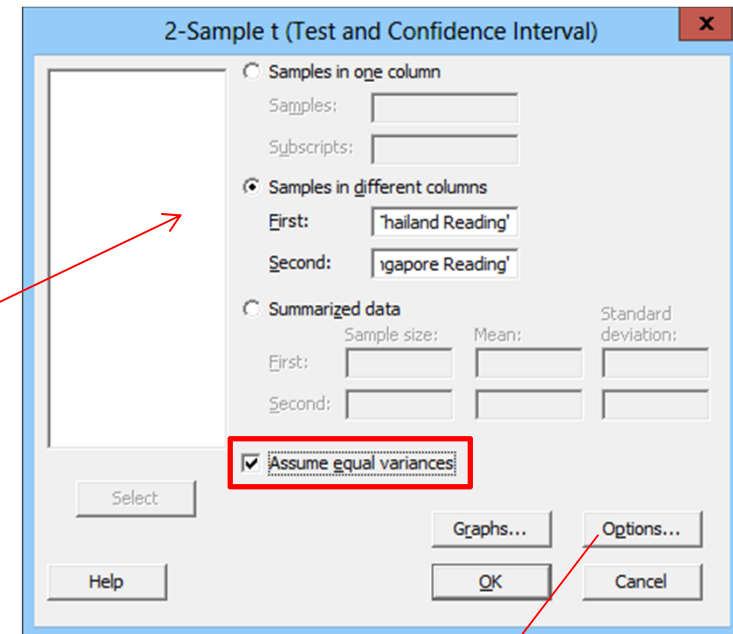

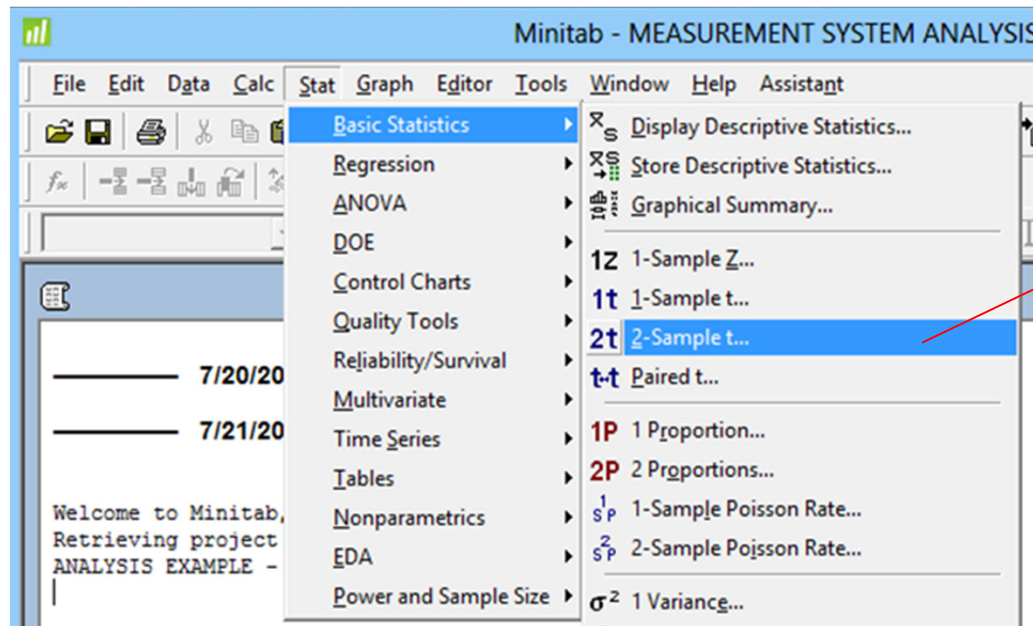

The difference must distribute normally for paired-T test.

What happens if we use wrong statistical tools to analyze the data?

If someone uses T-test to analyze the data, the results will look like this.

What happens if we use wrong statistical tools to analyze the data?

Two-Sample T-Test and CI: Thailand Reading, Singapore Reading

Two-sample T for Thailand Reading vs Singapore Reading

| | N | Mean | StDev | SE Mean |
|-------------------|----|-------|-------|---------|
| Thailand Reading | 90 | 15.10 | 1.21 | 0.13 |
| Singapore Reading | 90 | 15.29 | 1.18 | 0.12 |

Difference = μ (Thailand Reading) - μ (Singapore Reading)

Estimate for difference: -0.192

95% CI for difference: (-0.544, 0.160)

T-Test of difference = 0 (vs not =): T-Value = -1.08 P-Value = 0.283 DF = 178

Both use Pooled StDev = 1.1974

As mentioned before that the t-test and z-test are quite sensitive to part-to-part variation, which, in this case, is very large ($\sigma = 1.2$) compared to the difference (0.192) that we can observe, it is not surprised then that the results from this 2-sample t-test cannot confirm the difference between cartridge height readings between TH and SG plants.

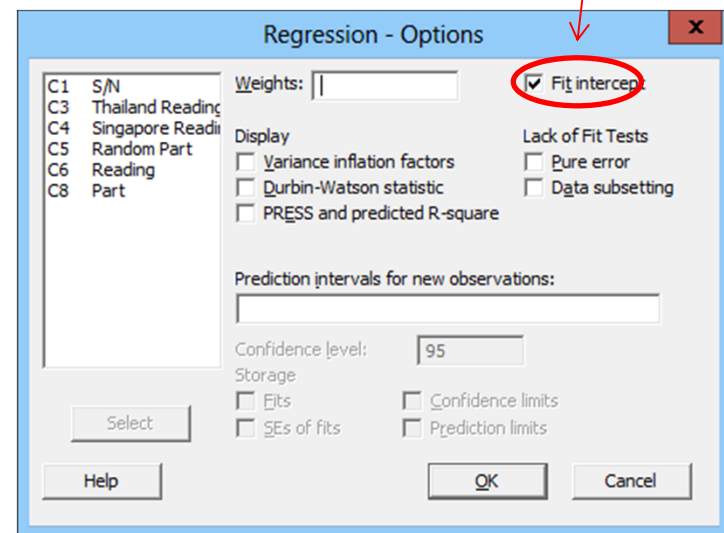

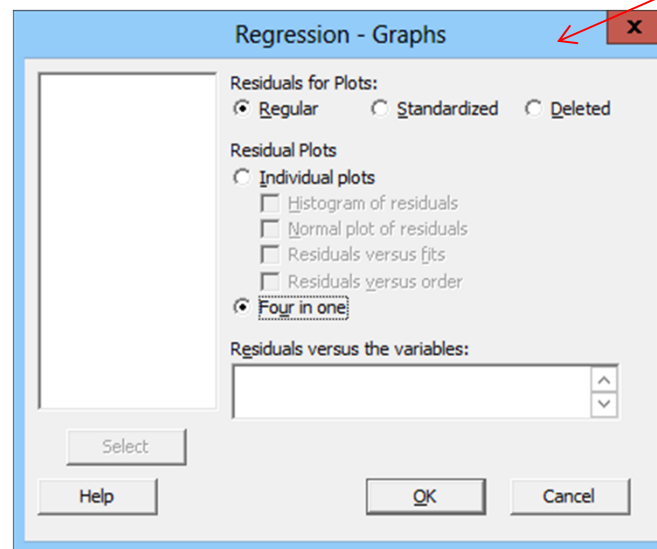

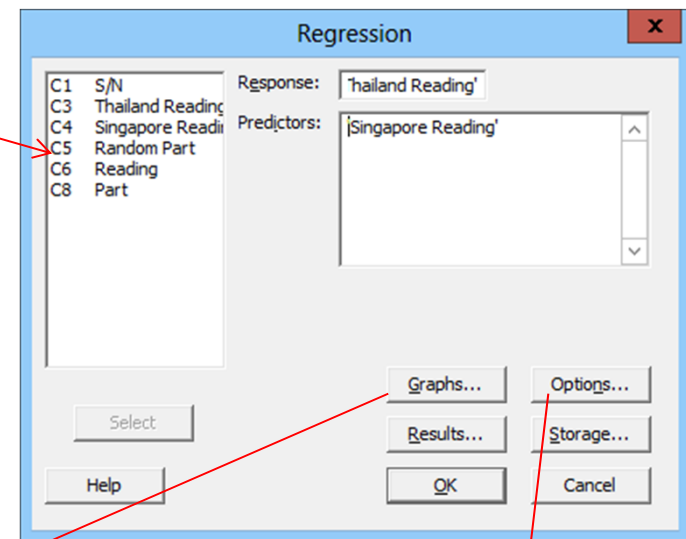

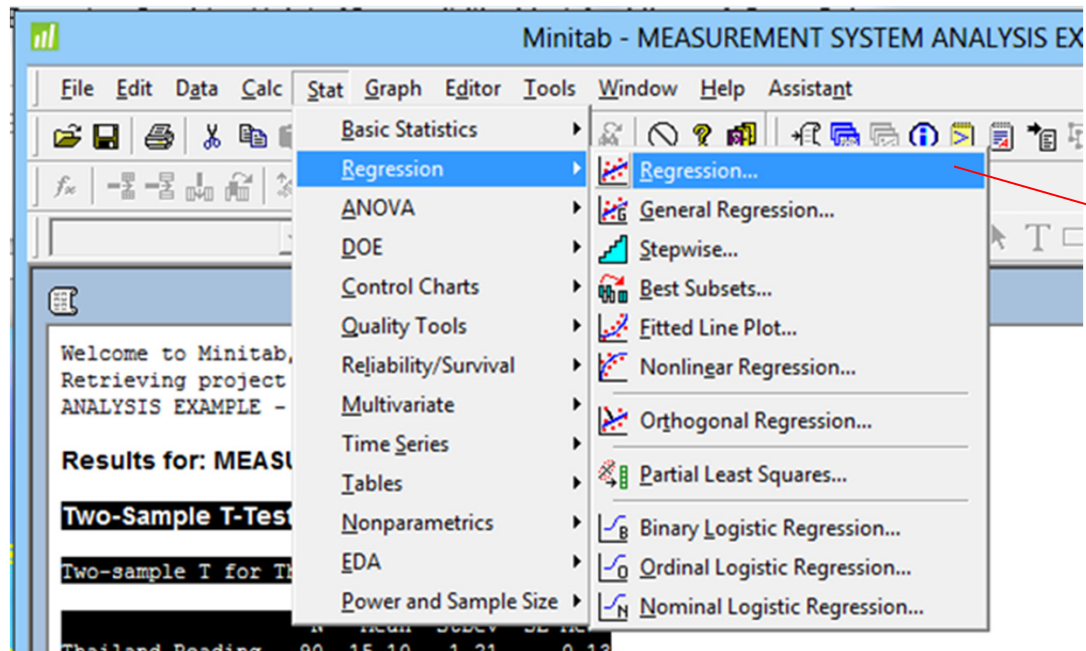

Action 3: Finding SG-TH Reading Correlation

Conclusion from previous analysis was:

“It is 95% confident that TH measures cartridge heights lower than SG by 0.1922 on average”. This helps explain why some HSA hit top cover at SG plant.

The question immediately followed is : how the readings are correlated? If correlations exist, we can then find new criteria for cartridge height spec to screen parts for SG plants.

We then begin the next step with simple linear regression.

Regression Analysis: Thailand Reading versus Singapore Reading

The regression equation is
Thailand Reading = - 0.432 + 1.02 Singapore Reading

$$(y = a + b*x)$$

| Predictor | Coef | SE Coef | T | P |
|-------------------|---------|---------|-------|-------|
| Constant | -0.4317 | 0.1730 | -2.50 | 0.014 |
| Singapore Reading | 1.01566 | 0.01128 | 90.03 | 0.000 |

Both a and b are significant.

S = 0.126091 R-Sq = 98.9%

R-Sq(adj) = 98.9%

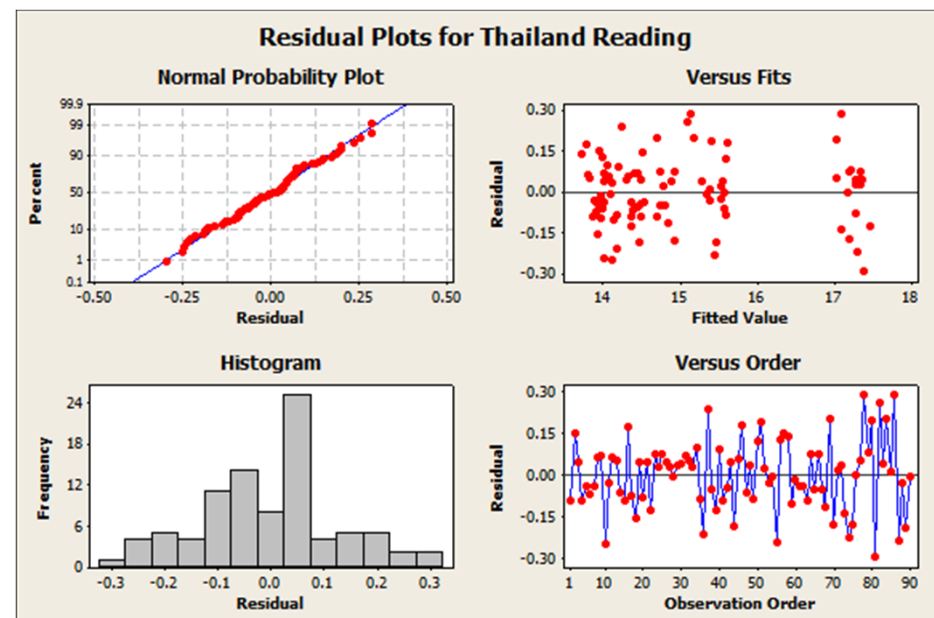

Regression model can explain 98.9% of the total spread (SS) in data.

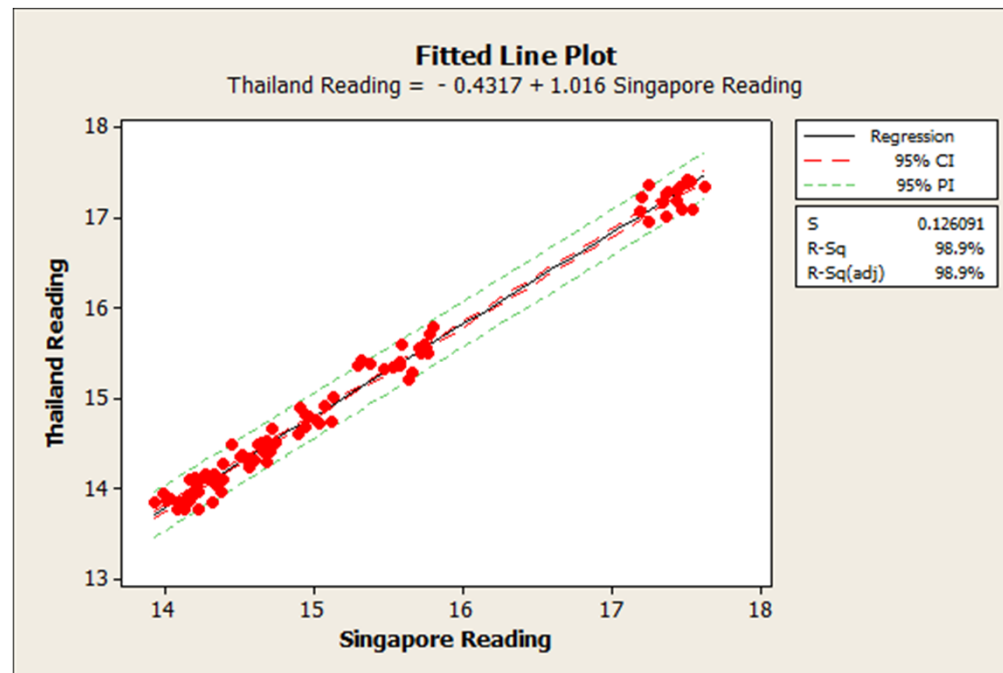

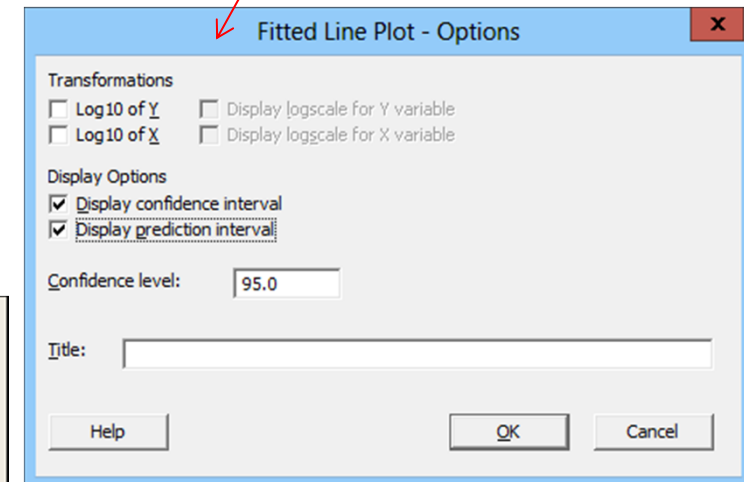

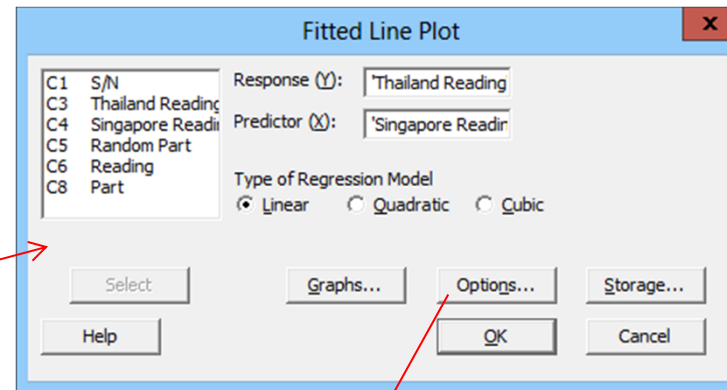

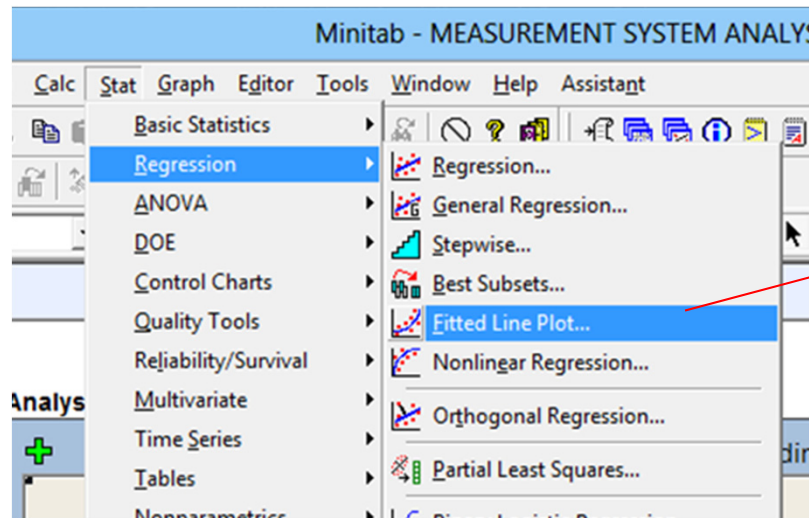

Analysis of Variance

| Source | DF | SS | MS | F | P |
|----------------|----|--------|--------|---------|-------|
| Regression | 1 | 128.88 | 128.88 | 8106.28 | 0.000 |
| Residual Error | 88 | 1.40 | 0.02 | | |
| Total | 89 | 130.28 | | | |

Regression is significant compared to error.

Model checking:
Is error $NID(0, \sigma^2)$?
Ans: Yes

Regression Plot

The regression equation is

Thailand Reading = - 0.432 + 1.02 Singapore Reading

If maximum cartridge height (before HSA hitting top cover) at SG plant is 17.5, what should be the cartridge height spec for TH plant screening before sending parts to SG?

Overall Corrective Actions:

TH: - Cut-in new spec for cartridge height screening.

- Use the regression model above to predict readings at SG.
- Set up tester SPC, Product SPC for yield and performance monitoring.

SG: - Tight control of cartridge installation process.

- Continuous monitoring and feedback.
