

# Methods in Computational Molecular Physics

Edited by

**Stephen Wilson**

Rutherford Appleton Laboratory  
Oxfordshire, United Kingdom

and

**Geerd H. F. Diercksen**

Max-Planck-Institut für Astrophysik  
Garching bei München, Germany

Plenum Press

New York and London

Published in cooperation with NATO Scientific Affairs Division

# Contents

<b>Introductory remarks</b>	1
<i>S. Wilson</i> , Rutherford Appleton Laboratory	
<b>An overview of molecular quantum mechanics</b>	3
<i>R. McWeeny</i> , University of Pisa	
1. Introductory remarks	3
2. The Schrödinger equation, Hamiltonian and wavefunction	3
3. Orbital expansions of the wavefunction	4
4. Permutational symmetry: Alternative expansions	6
5. Fock space	8
6. Optimization of the wave function	10
7. The CI problem: Methodology	14
References	17
<b>The Born-Oppenheimer approximation</b>	19
<i>B.T. Sutcliffe</i> , University of York	
1. Introduction	19
2. The clamped nucleus problem	19
3. The full molecule problem	21
4. Separating electronic and nuclear motion	32
5. The clamped nucleus Hamiltonian	41
6. Conclusions	45
References	45
<b>The electron correlation problem</b>	47
<i>R. McWeeny</i> , University of Pisa	
1. Introduction	47
2. Density functions and correlation	48
3. Linked cluster expansions	51
4. Methods of calculation	53
4.1 Correlated pair methods	53

4.2	Perturbation methods	54
5.	Alternative approaches: Correlation factors	54
	References	55
	<b>Unitary group approach to the many-electron correlation problem</b>	<b>57</b>
	<i>J. Paldus</i> , University of Waterloo	
	References	61
	<b>The configuration interaction approach to electron correlation</b>	<b>65</b>
	<i>J. Karwowski</i> , Nicholas Copernicus University	
1.	Introduction	65
2.	The symmetric group and the hamiltonian eigenvalue problem	67
3.	The configuration interaction space	70
4.	The configuration interaction method: General considerations	74
4.1	Hamiltonian in the CI space	75
4.2	The orbitals	76
4.3	The integrals	77
4.4	The configuration interaction expansion	78
5.	Matrix elements	80
6.	Strategy of CI calculations	84
6.1	Diagonalization	84
6.2	Direct CI method	85
6.3	Implementation	88
7.	Odds and ends	90
7.1	Size consistency	90
7.2	Semiempirical methods	92
	References	94
	<b>Coupled cluster theory</b>	<b>99</b>
	<i>J. Paldus</i> , University of Waterloo	
1.	Introduction	99
2.	Basic notation and formalism	101
2.1	Second quantization formalism	101
2.2	Particle-hole formalism	103
2.3	Diagrammatic representation	105
3.	MBPT origins of the cluster ansatz	108
3.1	Time independent MBPT	108
3.2	Diagrammatic MBPT	110
3.3	Factorization lemma	112
3.4	Linked cluster theorem	115
3.5	The connected cluster structure of the exact wave function	116
4.	Closed shell coupled cluster theory	119
4.1	Cluster ansatz and its diagrammatic representation	120
4.2	Connected and disconnected clusters	121
4.3	Connected cluster theorem	123
4.3.1	Diagrammatic derivation	123
4.3.2	Algebraic derivation	126

4.4	CC formalism: Basic consideration	128
4.5	Explicit CC equations	131
4.5.1	CCD equations (spin-orbital form)	131
4.5.2	Higher than CCD approximations	136
4.6	Relationship with other approaches	137
4.6.1	Variational approaches	138
4.6.2	Perturbative approaches	145
4.7	Spin-adapted CC formalism	151
4.8	Calculation of properties	153
4.9	Computational implementation	158
5.	Multi-reference CC theory	160
5.1	Model space	161
5.2	Effective Hamiltonian and Bloch equation	168
5.3	Cluster ansätze	170
5.4	Model algebras	172
5.5	Valence-universal operators	174
5.6	Basic OS cluster ansätze	176
5.6.1	Fock space approaches	176
5.6.2	Hilbert space approaches	178
5.7	Cluster conditions	181
5.8	Incomplete model spaces	182
6.	Conclusions	183
	Acknowledgements	184
	References	184

**The perturbation theory of electron correlation: I. Basic  
Rayleigh-Schrödinger perturbation theory** 195

*S. Wilson*, Rutherford Appleton Laboratory

1.	Introduction	195
2.	Perturbation theory	196
2.1	Rayleigh-Schrödinger perturbation theory	196
2.2	Non-degenerate Rayleigh-Schrödinger perturbation theory	197
2.3	Perturbed wave functions	199
2.4	Energy coefficients	200
2.5	Wigner's $2n+1$ rule	203
3.	Double perturbation theory	205
3.1	Double Rayleigh-Schrödinger perturbation theory	205
3.2	Perturbed wave functions	207
3.3	Energy coefficients	208
4.	Sum-over-states formulae	209
4.1	Single Rayleigh-Schrödinger perturbation theory	209
4.2	Double Rayleigh-Schrödinger perturbation theory	212
5.	Degenerate Rayleigh-Schrödinger perturbation theory	212
5.1	Basic formalism	212
5.2	Zero-order degenerate Rayleigh-Schrödinger perturbation theory	216
5.3	First-order degenerate Rayleigh-Schrödinger perturbation theory	216
5.4	Second-order and higher-order degenerate Rayleigh-Schrödinger perturbation theory	217
5.5	Quasi-degenerate Rayleigh-Schrödinger perturbation theory	217
6.	Rayleigh-Schrödinger perturbation theory for non-orthogonal functions	219

2.	The classical VB approach	325
3.	Modern ab initio valence bond theory	328
4.	Methods of implementation of the theory	330
5.	Conclusion	336
	References	337

## Molecular properties 339

*R. McWeeny*, University of Pisa

1.	Introduction	339
2.	Small terms in the hamiltonian	339
3.	Formal expressions for response	341
4.	Methods of calculation	342
5.	The interpretation of molecular properties	346
6.	Conclusion	351
	References	351

## Calculation of geometrical derivatives in molecular electronic structure theory 353

*T. Helgaker*, University of Oslo, and *P. Jørgensen*, Aarhus University

1.	Introduction	353
2.	Derivatives of variational energies	355
	A. Variational wave functions	355
	B. Derivatives for variational wave functions	357
	C. Derivative for non-variational wave functions	359
	D. Variational perturbation theory	361
	1. Perturbed energy functions	363
	2. Perturbed variational conditions	366
	3. Perturbed energies	368
	4. Numerical errors	369
	5. Non-variational wave functions and Lagrangians	372
3.	Derivatives of the Hamiltonian	376
	A. The Hamiltonian at the reference geometry	376
	B. Orbital connections	377
	C. Geometry dependence of the Hamiltonian	379
	D. Derivatives of the integrals	381
	E. Hamiltonian commutators	385
4.	Derivatives for specific wave functions	386
	A. MCSCF	386
	B. CI derivatives	390
	C. CC derivatives	393
	D. Møller-Plesset derivatives	396
5.	Calculation of derivatives	401
	A. Lagrange multipliers	401
	B. Variational densities	403
	C. Molecular gradients	405
	D. Response equations	408
	E. Molecular Hessians	410
6.	Translational and rotational symmetries	413
7.	Concluding remarks	418
	References	419

**Calculation of molecular rotation-vibration energies directly from  
the potential energy function** 423

*P. Jensen*, Justus Liebig University

1. Introduction	423
2. The choice of rotation-vibration coordinates	424
2.1 Translation	424
2.2 Rotation and vibration	426
2.3 Hamiltonians in mass-dependent vibrational coordinates	427
2.4 Hamiltonians in geometrically defined vibrational coordinates	429
3. The standard approach	430
3.1 The Eckart equations	430
3.2 Normal coordinates	432
3.3 The van Vleck transformation	436
3.4 The contact transformation	437
4. The Hougen-Bunker-Johns approach	438
4.1 Coordinates for the large amplitude motion	438
4.2 Coordinates for the small amplitude motion	441
4.3 The HBJ Hamiltonian	442
4.4 The nonrigid bender Hamiltonian	443
4.5 Nonrigid bender calculations	444
5. The MORBID approach	446
6. Hamiltonian using geometrically defined coordinates.	450
6.1 A Hamiltonian for a triatomic molecule	451
6.2 Variational calculations	452
6.3 Close-coupling calculations	453
6.4 The DVR-DGB approach	454
7. Conclusions	456
8. Fitting to experimental data	457
9. Calculations of molecular properties	460
Acknowledgements	466
References	466

**Many-body perturbation theory for vibrational-electronic molecular  
hamiltonian** 471

*I. Hubač and M. Svrček*, Comenius University

1. Introduction	471
2. The molecular vibrational-electronic (V-E) Hamiltonian	475
3. Canonical transformations defined for the mixed system of fermions and bosons.	482
4. Adiabatic representation of V-E Hamiltonian. Diagrammatic technique	487
5. Non-adiabatic representations of the V-E Hamiltonian	496
References	510

**Relativistic electronic structure theory** 513

*I.P. Grant*, University of Oxford

1. Introduction	513
-----------------	-----

2. Where do we look for relativistic effects ?	513
3. QED of atoms and molecules	514
4. State of the art in relativistic atomic structure	515
5. State of the art in molecular structure	516
References	517
<b>Quantum mechanical scattering theory for chemical reactions</b>	<b>519</b>
<i>W.H. Miller, University of California</i>	
1. Introduction	519
2. Why a basis set variational approach to reactive scattering ?	519
3. The S-matrix version of the Kohn variational principle	522
4. Enhancements of the methodology	526
5. Some applications	529
6. Concluding remarks	532
Acknowledgements	532
