Mobile App *Guide*

THE UNIVERSITY OF
CHICAGO MEDICINE &
BIOLOGICAL SCIENCES

CENTER FOR
RESEARCH
INFORMATICS

About the Mobile App

REDCap software provides its online users with the ability to create and manage surveys and databases quickly and securely to facilitate data collection. The REDCap Mobile App adds a new dimension to the software's versatility by providing users with a tool for offline data collection, particularly in environments with poor internet connectivity. REDCap users can now collect their REDCap data in a mobile app on an iPhone, iPad, or Android phone or tablet. With REDCap and the REDCap Mobile App, users have new options for electronic data capture for studies that under previous circumstances would have dictated pen and paper. The app cannot be used on its own but is a companion app that must be used alongside REDCap itself. All users of the app must already be a REDCap user at UChicago before using the mobile app.

Workflow

The REDCap mobile app is an app that can be installed on a tablet or mobile device so that data may then be collected in an offline fashion on that device, after which it may then be synced back to this project on the REDCap server. The app is most useful when data collection will be performed where there is no internet service (e.g., no WiFi or cellular service) or where there is unreliable internet service. Once a user in the project is given 'REDCap Mobile App' privileges, they can navigate to the mobile app page on the project's left-hand menu and set up the project inside the mobile app on their device. Once the mobile project is set up on the device, the user can collect data (which is stored locally on the device), and then at some point sync that data back to this project on the REDCap server.

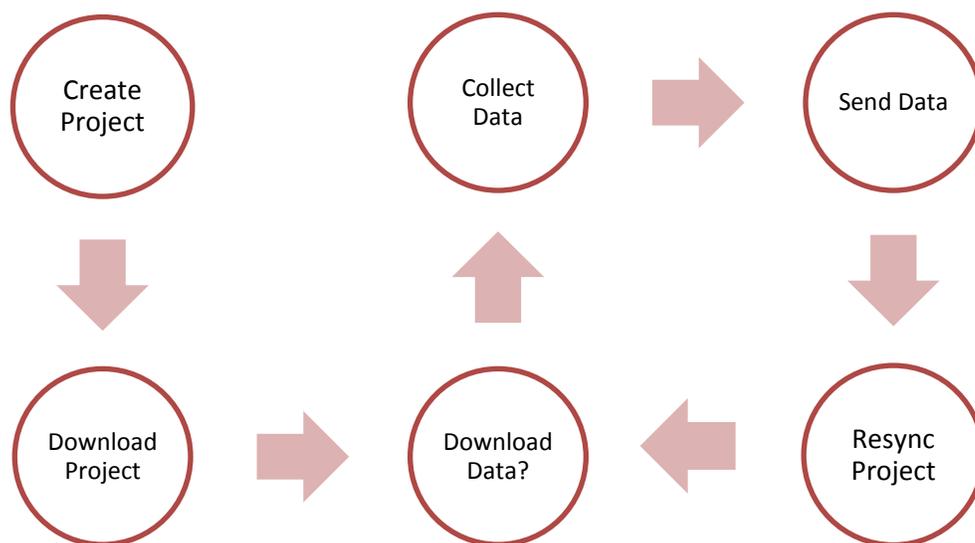

App Concept

These are the steps for a high level view of how the Mobile App works:

1. **Create** and design project on your REDCap installation. Grant Mobile App Rights and get token.
2. **Set Up** project. While online, set up the project on the app using a code provided in REDCap.

3. **Collect** data from participants. This can be done offline, or online (if internet access becomes available).
4. **Send** affected data to the REDCap server securely. New records are sent as a package; modified records have their values adjudicated against existing server values. The app user will then be given a chance to refresh the project. This step must be done online.
5. **View and Analyze** data. Once the data is uploaded to REDCap, it is a living part of the project.

Admin Interface

With the specially-created password, the admin user can log in. This will result in accessing a special interface that enables the admin to do just about everything in the app but collect data. This allows projects the ability to separate data collection from app administration through user rights management. Or if full access is desired for users, then full rights can be given, and the admin interface need not be used - which is the default. An admin can add users and customize user rights. User passwords can be reset here. When a user is created, full rights are automatically given. The admin (and only the admin) can revoke rights. If all rights are revoked, the user can only collect data for new records. This allows a sort of user management for projects depending on the trust and the ability of the data collector. Projects can be managed by the admin interface for each user. One can set up a mobile app project. One can also send any data for a project. Data can be dumped to the Mobile App File Repository on REDCap, logs can be sent, and projects can be refreshed. Everything but data collection is possible through this interface.
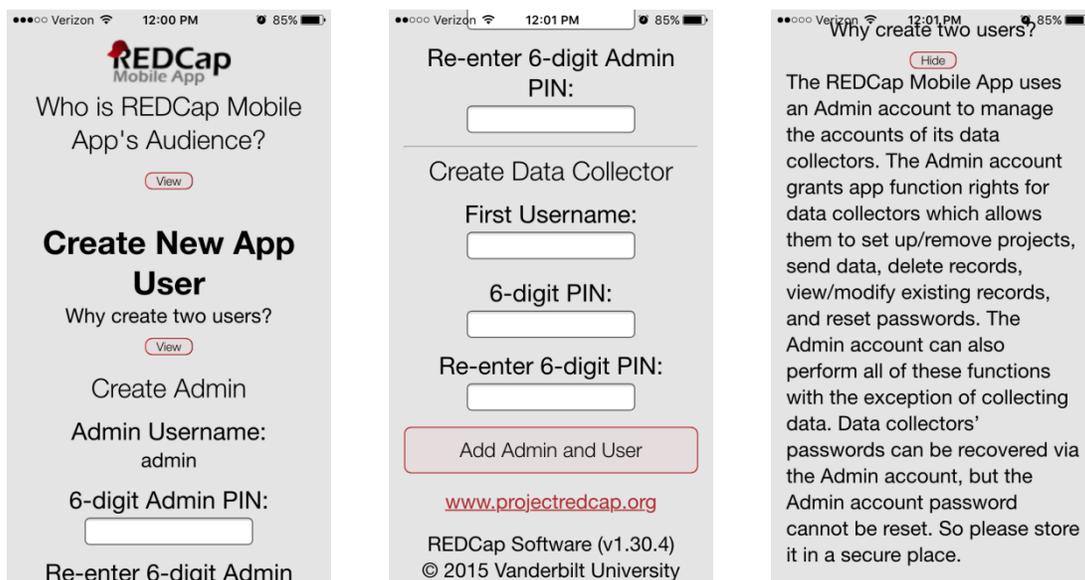

User Responsibilities

REDCap Project Creator:

- Create and design the REDCap project.
- Grant mobile rights access to the appropriate REDCap users.

REDCap User:

- Create a token for the project so that it can be distributed to the App User.
- Coordinate data reception from the app(s). No action is required other than monitoring the project.

App (Device) User:

- Download the project onto the app.
- Collect data on the app.
- Send data from the app to the server at an appropriate time.
- Keep the project up-to-date by reinitializing the project after data is sent.

User Management

You can add multiple users to the device in the Add & Manage Users section. Each user will have a unique PIN that you assign to provide access. Each app user, however, maintains unique project copies on the device and cannot share the same REDCap Mobile App projects. An app user downloads the main project from a REDCap user on the server with the opportunity to download all data that has been entered or uploaded. This app user collects data separately from anyone else (i.e., the data is siloed to each app user and then again, to each REDCap Mobile App project). When the app user sends data to the server, the process handles duplicate record ID's and conflicting data, and conflicts are presented to the app user. (This is described in the Sending Data section.) After the data is sent, the REDCap user can view the data.

User Rights in the Mobile App

It is important to note that the user privileges inside the REDCap Mobile App mimic a user's privileges in the project on the REDCap server with regard to data collection. For instance, if a user has 'No Access' Data Entry Rights for a specific data collection instrument, then the user will also not have access to that instrument in the app. There is an additional user privilege associated with the app that allows you to choose whether or not the user is able to download data (i.e., records in this project) to the mobile app on their device. For example, you may choose not to allow them to download record data to the app if this project contains very sensitive data (e.g., PHI).

_____

Getting started

1. **Log into REDCap** and select your correlating project from your "My Projects" page.

2. **Grant mobile apps rights**. Locate the Applications features on the left sidebar. Choose the User Rights application and add REDCap Mobile App rights for yourself or another appropriate user. By rule, you will now be able to download the full data set and request an API token regardless of previous permissions levels.

Settings pertaining to the REDCap Mobile App:

3. **Request token and get app access code**. Click the REDCap Mobile App link on the sidebar and request an API token. Once the token is created, return to that page (or refresh the page). A QR code is now available under the Initialize Project in Mobile App tab. If you have trouble with the QR code, click the "Can't get the QR code to work?" link to access a 10-character access code that can be entered manually.

⚠ NOTICE: In order to set up this project in the REDCap mobile app, you must first request an API token.

You currently do not have an API token yet for this project. Having a REDCap API token allows other programs, scripts, or apps to communicate with the REDCap server remotely. An API token is required for using the REDCap mobile app so that the app can download and upload your project information and data. To request an API token, simply click the button below, which will send an email request to your local REDCap administrator. Once they have granted you an API token, in which you will be notified via email, then you may return to this page to set up this project on the REDCap mobile app on your device.

☐ Request API token

It is assumed that you have already downloaded the REDCap mobile app on your mobile device or tablet. To set up this project in the REDCap app, open the app on your device, click the 'Set Up Mobile Project' button, then click the 'Scan QR Code' button, and then scan the QR code that you see displayed below.

Alternative method to set up project:

An alternative way to set up this project in your REDCap app on your mobile device or tablet is to use an initialization code. To do this, open the app on your device, click the 'Set Up Mobile Project' button, and near the bottom of that page enter the code that you see displayed below. NOTE: The initialization code will expire in 10 minutes.

Initialization code: XHNAL33184

4. **Download and open the app on your device**. Download the Mobile App on your iOS or Android device by searching the App Store or Google Play Store for 'REDCap' on your mobile device to find the app there to download. The app is available for the following platforms: iOS 6.0 or later (iPhone 4 and up, iPad 2 and up) and Android 4.3 or later (phones and tablets). Below are the links for downloading the app from the Apple App Store or from the Google Play Store (depending on what type of mobile device you have).

iOS app on App Store
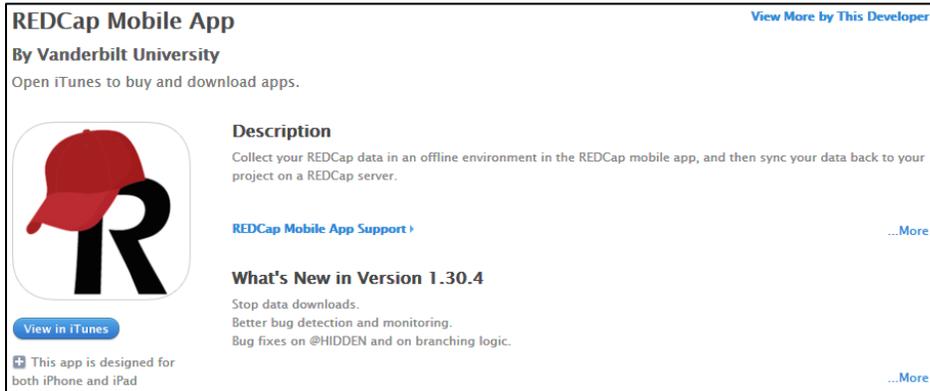

Android app on Google Play
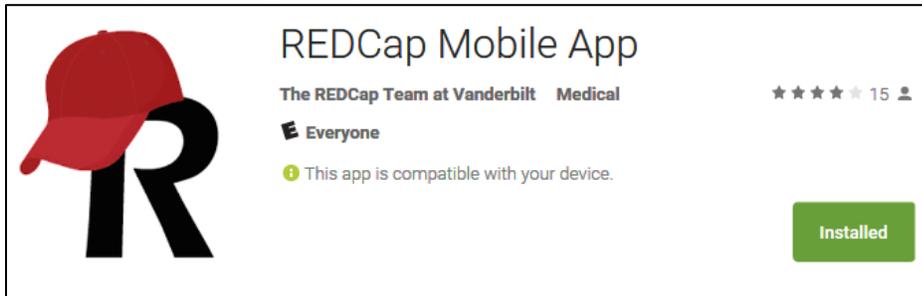

5. **Set up the project**. Click the 'Set Up Mobile Project' button.

Downloading a project: New project creation is not possible in the app itself. The app's purpose is to collect data offline that will later be added to an existing project in the web based REDCap application.
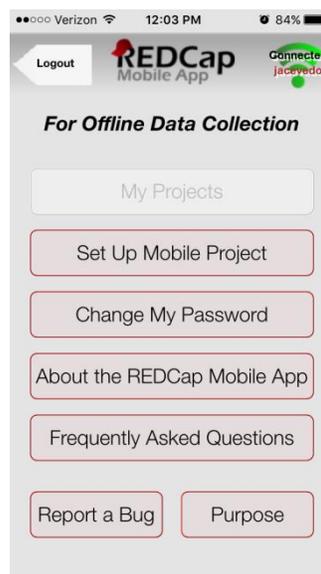

Optionally downloading data: In addition to the data collection instruments, you can choose whether you want to download data from the project or not. This process happens while online immediately after adding or resynchronizing the mobile project. When resynchronizing a mobile project on the REDCap Mobile App, all existing data for that project on the app will be deleted. (This will not affect any other projects that you have added in the app.)

6. **Provide the code**. Click the Scan QR Code and Initialize button. Scan the QR code that you see displayed or enter the 10-character access code here. If correct, either will grant you access to the project which has now been replicated on your device for offline data collection.
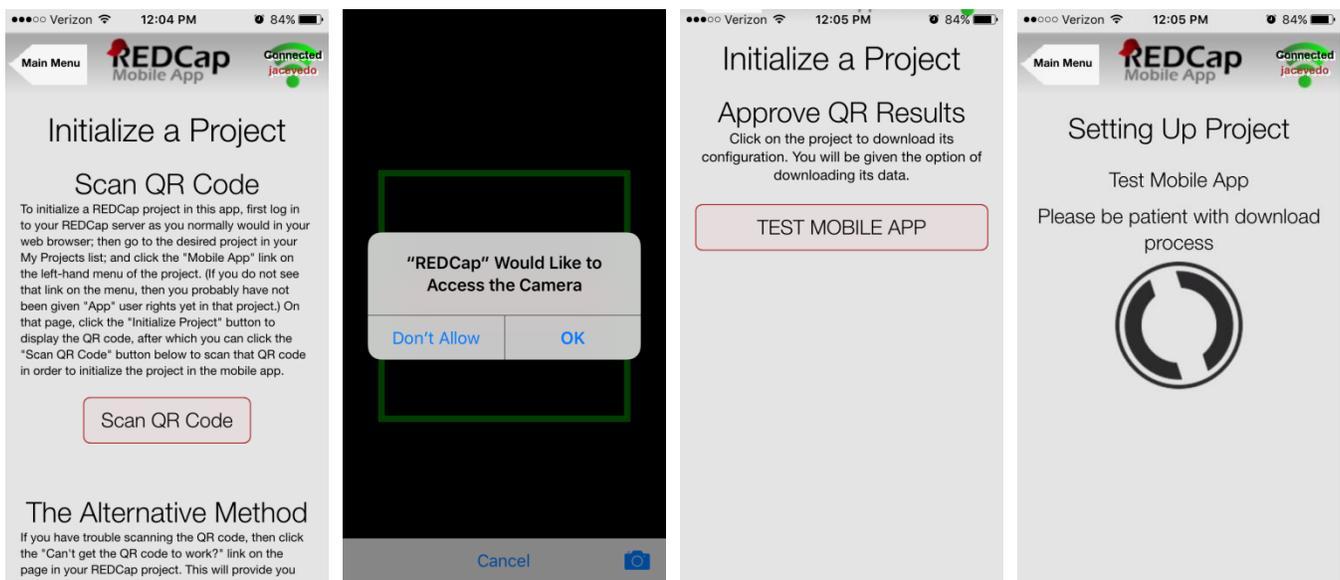

Data collection

- With the project in place, you can begin data collection for both new and existing records.
- Tap the Collect Data button and choose an instrument and a record. (This selection order is slightly different for classical projects, one-armed longitudinal projects, and multi-armed longitudinal projects.)
- If this is a new record, you must choose the first instrument. If this is a new record on a project without auto-numbering enabled, you will also have to choose a record name.
- Enter data and set the form status at the bottom as needed.
- Save your data in one of three ways:
  - Save Record (to save data entered and return to the records list)
  - Save and Continue (to save data entered and remain on the same screen)
  - Save and go to Next Instrument (to save data entered and move on to the next instrument in sequence)
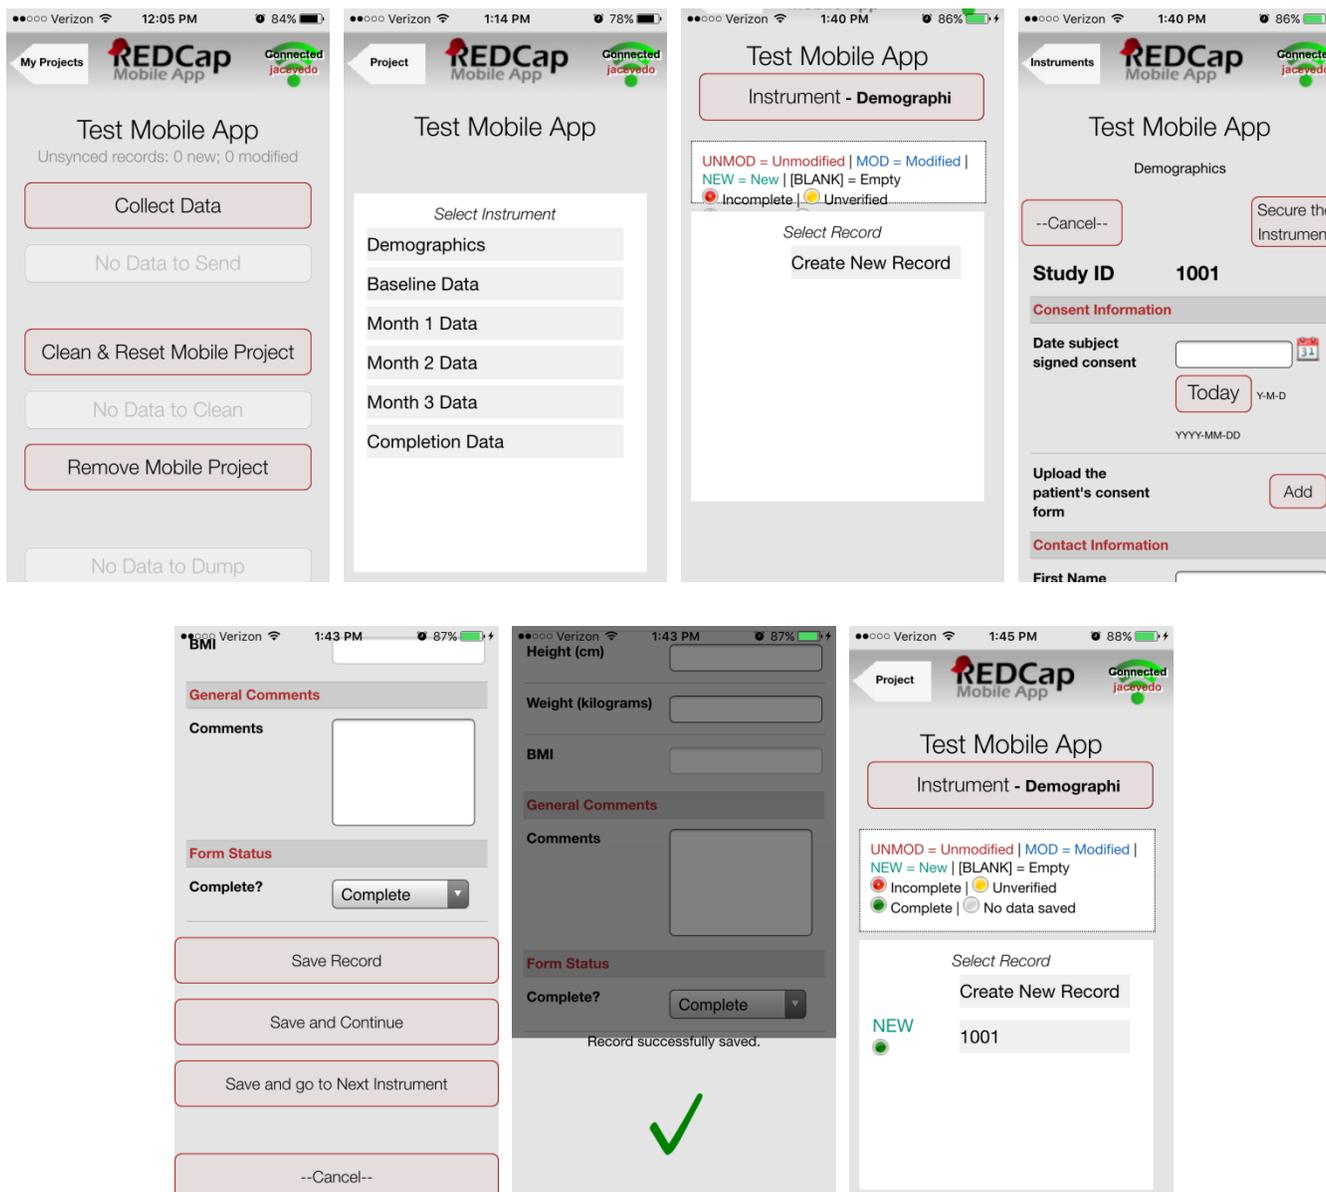

Data collection features:

- Besides free text and structured data entry, pictures, videos, and audio can be uploaded into designated file fields. Signatures can be captured as well.
- Records can be renamed on the first form. Note that renamed records will appear as new records when uploaded to the main database, so you will need to delete the original record there to complete the replacement process.
- Instruments can be secured so that participants/users will only have the option of entering data (and not traversing the rest of the app, which can jeopardize confidentiality). They can be unlocked via the primary user's pin.
- The amount of data collection is only restricted by what your device's hard drive will allow.
- All data collection can be offline – without Internet access.

Sending Data

When back online, you can send data to the project's REDCap server. This will coordinate the mobile device's data with the main REDCap project. If record names or data values conflict, you will be given the opportunity to make adjustments before completing the upload. If the instruments themselves have been modified significantly in the main REDCap project since REDCap Mobile App project setup, you will not be able to complete the upload.

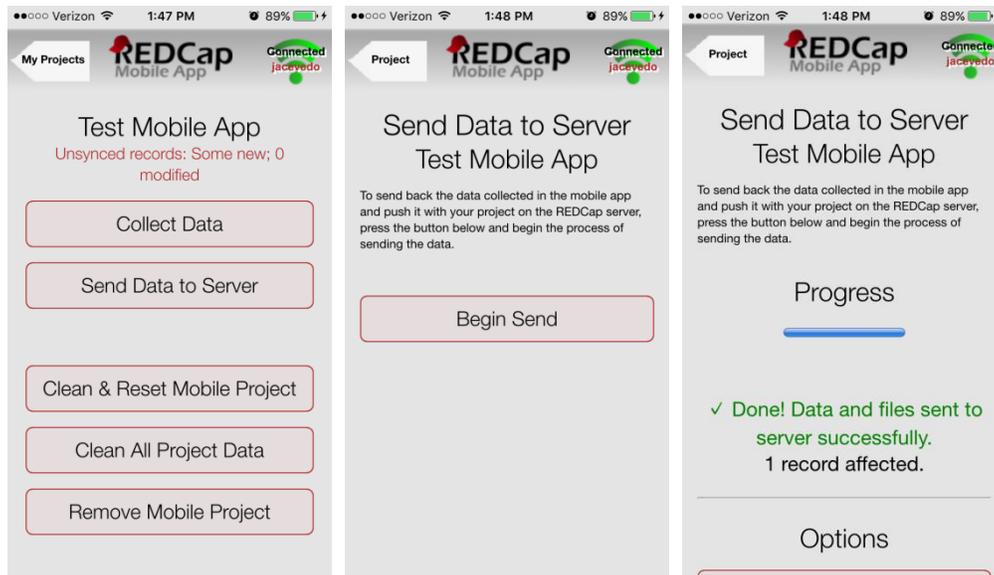

- In the app, click on Send Data to Server.
- Click the Begin Send button.
- New records will be added to the main REDCap project immediately if no conflicts exist or if conflicts exist but are automatically resolved by the app.
  - If there are no duplicate record names/numbers, records will upload with the names/numbers assigned at the app.
  - If auto-numbering is enabled and there is a record name conflict, REDCap will automatically update the record numbers to the next numerical series of numbers before uploading and provide details on the app page.
  - If auto-numbering is not enabled, a new ID number is suggested but can be modified unless its name conflicts with a new record on the server.
- Existing records that have been modified on the app will have modifications detailed on the app page.
  - An option to send the data to the server for each modified record appears, as well as the opportunity to view details of the differences between server data and app data for that record. Individual field values can be selected from the details (i.e., server vs. mobile device).
  - Each record that has been modified is usually auto-filled with a "Yes" response to the "Send data to the server?" question. If after reviewing the scheduled changes for that record, you decide not to make the update, change the response to "No" to remove it from the upload queue.
  - To choose field-level changes, click on the cells that have the information you want to enter for the record. You can choose from either the app side or the server side of the table.

- o Special scenarios to note:
    - If a record is deleted from the main project after it has been replicated in the app and a change was not made to the app record, the record will not upload from the app to the project as a replacement. You will not receive a notification from the app or server that the original record has been deleted.
    - If a record is deleted from the main project after it has been replicated in the app and a change was made to the app record, you will receive a notification and option to change the ID number and upload as a new record, or not to upload the record at all.
    - If a record is deleted from the app, it will not be deleted from the server after data syncing. You may only delete records from the main project on the server.
    - For cases where auto-numbering is disabled, if a new record was entered on the server with the same ID as a new record entered on the app, you are given the options to merge the data, to upload the app data with a new ID, or not to upload the data.
- Click Send Records with Changes to complete data upload when ready.
- Click Clean & Reset Mobile Project (recommended) to remove old mobile data and replace with the most current project information from the main REDCap project, or choose Back to Project to continue working with the same data. If you choose Back to Project, uploaded data will no longer be marked as new or modified; that is, it will no longer be queued for upload.
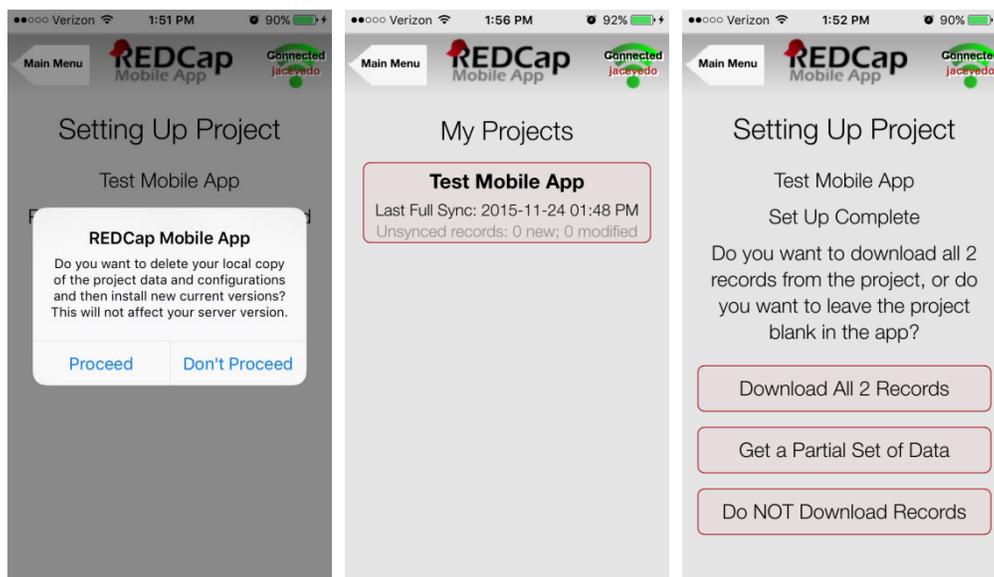

Record Status Dashboard in REDCap

Study ID	Demographics	Baseline Data	Month 1 Data	Month 2 Data	Month 3 Data	Completion Data
1000	●	○	○	○	○	○
1001	●	○	○	○	○	○

Mobile App Dashboard in REDCap

_____

Frequently Asked Questions

1. When should I use the app?

Use the app when you need offline data collection, particularly in environments with poor internet connectivity. With REDCap and the REDCap Mobile App, users have new options for electronic data capture for studies that under previous circumstances would have dictated pen and paper.

2. What devices are supported?

- iOS iPhone 4 and up, iPad 2 and up - requires iOS 6.0 or later
- Android - phone or tablet - Requires Android 4.3 and up.

3. What type of device is best for what projects?

Since these devices are supported by the same code, the user experience is almost the same on any device. Users have provided some feedback, however, related to their particular projects that may be helpful. The Android devices have better global reach, so they are better with global health projects. The Android devices also seem slightly better with extremely large projects (1000+ records). Apple delivers better quality of device in their iPads, which is generally recognized as the best device on the market.

4. What features of REDCap are supported?

- Data entry
- DAGS
- GPS
- Pictures, videos, and audio can be uploaded into designated file fields.
- Signatures fields
- Action tags
- Instruments can be secured so that participants/users can enter their own data.

5. What noteworthy features of REDCap aren't supported?

- CATS (Computer Adaptive Test Surveys)
- Double data entry
- Survey specific features
- Survey queue
- Randomization
- Viewing files
- Inline audio/video
- Survey instructions
- Survey stop actions
- Survey thank-you text
- Downloadable files in file fields

6. How are surveys and forms handled?

Normal REDCap Survey features are not used for Mobile App data collection. They are treated as entire forms without the pagination. Instruments can be secured with a pin so that participants/users will only have the option of entering data when the device is handed over to them. The instrument can be locked/unlocked via the primary user's pin.

7. What are the weaknesses of the app?

If you have online access, REDCap Mobile (the mobile version of REDCap https://redcap.uchicago.edu/) is a better platform because it inputs data directly into REDCap. Sending data simultaneously from multiple devices is not supported. Sending data is, at present, a complicated process.

8. How are bugs reported?

- Bugs can be reported by submitting them through the Report a Bug button on the app or by emailing redcapapp@vanderbilt.edu.
- The following information is requested from the user to in order to replicate the bug and trouble shoot the issue:
    - Android or iOS or both?
    - Can you email us your QR Code?
    - Is your REDCap server behind a firewall?
    - Does your project contain PHI? (If so, we won't download data.)
    - In detail, how does this error manifest itself?

9. What if a bug keeps me from accessing my data?

- Email redcapapp@vanderbilt.edu.
- Fixes for the Android are usually accomplished in two business days or often less. Fixes for Apple devices take longer (1-2 weeks) due to Apple's approval process.

10. What is the workflow of the app?

- Via an admin: Create a user; push projects to them; let them collect data; allow them to send data or send data yourself; clean & refresh the project; repeat; remove project.
- Via a user: Set up a project or multiple projects; collect data; send data; clean & refresh the project; repeat; remove project.

11. Can I limit users of my app so that they cannot do all functions?

User access can be restricted through the administrator interface. An administrator on the app can assign users the appropriate level of data access rights.

12. Can I use multi-tablet setups?

Yes, so far as of September 2015, the record is 80 tablets.

13. Can I use data access groups?

Yes, Data Access Groups (DAGs) are supported by the app. Whichever REDCap user supplies the download code – this user's DAG is used.

14. Can I restrict access to data?

Access to data can be restricted by using DAGs. You can also restrict all data via the user rights.

15. What happens if the app hangs (i.e., does not do anything for a long time)?

Email redcapapp@vanderbilt.edu with detailed instructions. If you can provide a QR code without jeopardizing patient information, please do so.

16. What happens if the app crashes (i.e., closes unexpectedly)?

This is a memory problem and probably occurred while sending data. It is probably best to perform an Emergency Data Dump. This will send a CSV to the Mobile App's File Repository. This CSV can then be used to feed the Data Import Tool. This only works while the device is online, of course.

An Emergency Data Dump should also be performed if changes have been made to the project's metadata before sycing has occurred. The data dump will export the CSV data file to the Mobile App page's Files section in the project. Take that file and then adjust the values to import it so that it matches the newer metadata.

17. Are non-English languages supported?

We are exploring how to do this. Your instruments can be displayed in any UTF-8 (Unicode-8) character set. We hope to provide the actual text of the app for translation, but the mechanism's design is still under work.

18. How do I get this approved by my IRB?

- Providing them with the security document at projectredcap.org should answer most questions.
- The 6-digit PIN offers added protection
- Logging in after a short timeout requires a PIN under the login rules.
- Data values, tokens, and user PINs are stored using AES encryption inside the database.

- All transmission is done via SSL (https) if you have this installed on your server. It is recommended to have a certificate approved by the Certificate Authority, but self-signed certificates are allowed with a warning. Unsecure (http) transmission is also allowed, but with a warning. Unsecure (http) transmission, however, is not recommended for production use.
- Data is considered part of the project only after upload to REDCap. Data left on the device is not considered part of the project. Therefore, REDCap's Logging tool is considered a fair historical guide to what is in and not in the project. Furthermore, the app has logs that can be sent to the Mobile App's File Repository within REDCap. This collects information about views, edits, and creations of project data.

19. What issues are involved with projects with a large amount of records?
The amount of data collection is only restricted by what your device's hard drive will allow. Sending a large amount of records to REDCap could cause a memory crash on certain devices.

20. My QR code isn't showing up in REDCap. What should I do?
Contact the system administrators for your server and ask them to check that libgd and php-gd are both installed.

21. What happens if I cannot initialize a project? (As in "Cannot get form rights!")
You are either having trouble accessing your server (perhaps because of low signal or a firewall) or because you do not have proper user rights setup. Try enabling your user's rights for the REDCap Mobile App and for API Import/Export.

22. Are you having any sort of trouble?
Upgrade to the latest version via the app store. If you're still having trouble, then send us a bug report.
_____

Security Features
- **Secure Data Transmission**: Data is transmitted securely to and from the REDCap server via SSL (https) if it is set up on the server.
- **Secure Data Storage Encryption**: Encryption prevents any unauthorized users from accessing data in the app, even if they were to gain access to the device's file system in some way (whether using a direct hardware connection or via other software on the device).
  - PINs are ciphered using SHA cryptography, and all stored REDCap data values (potential PHI or PII), API tokens, and REDCap app logs are encrypted using AES encryption standard on the mobile device's hard drive.
  - The encryption keys are stored in iOS's Keychain and Android's KeyStore, which is standard practice for achieving the highest level of security for encrypted data stored in iOS and Android.
  - Note about external/detachable drives: The REDCap Mobile App does not allow any data to be stored on external hard drives (e.g., USB Flash drives) connected to the mobile device. To maintain the greatest level of security, the app only allows the device's internal hard drive to be used for data storage.

- **Application**: A login with a 6-digit pin is required to access the application. Five login attempts are allowed before lockout, and a 15-minute lockout period is initiated. When the application is sent to the background or is cloaked with a screen saver, the pin is required again to access the application if a user is logged on. Similar log in attempt rules and lockout rules apply when the user reenters the application.
- **Instrument**: The Secure the Instrument feature restricts access by a participant to a single form. Enabling this feature allows you to hand over the device to a participant to enter information directly, but locks the participant out of the rest of the application as well as other forms. REDCap Mobile App user's 6-digit pin is required to unlock the form. Similarly, the 6-digit pin is required to reenter the form if the participant minimizes the application or if a screen saver interrupts form entry.
- **Logs**: Project logs for activity on the REDCap Mobile App are stored in the database's Mobile App File Archive. These can be transmitted to the server (for one given project) via the Send Project Logs button on the Project menu. These logs record data creation, modifications, and uploads; renaming, deletion, and viewing of records; and downloads of project instruments and records.

To read more about the app's security, please go to: http://projectredcap.org/app/security.pdf

Security Guidelines
BSD Information Security developed the following guidelines for securing devices:

> Securing an iOS Device
> Securing an Android Device

Project owners should ensure their devices are properly protected and they are expected to safeguard all project information. For additional questions on security, please contact BSD Information Security at security@bsd.uchicago.edu.

What happens if a tablet or phone is stolen or lost?
Go to REDCap and revoke the API token – unless there is more than one device distributed with this token. If there is only one device, revoking the API token will not allow the thief to send data, download new data, or refresh the project. Further, when online, the thief cannot access any existing data. If there are multiple devices, revoking the API token will disable ALL devices. Use with care. Either way, access is protected with a PIN.

Additional Questions?
Please contact REDCap Support at redcap@rt.cri.uchicago.edu.
