

# MTConnect® Standard

Part 5 – Interfaces Version 1.8.0

> Prepared for: MTConnect Institute Prepared on: September 6, 2021

## **MTConnect Specification and Materials**

The Association for Manufacturing Technology (AMT) owns the copyright in this *MT-Connect* Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this *MTConnect* Specification or Material, provided that you may only copy or redistribute the *MTConnect* Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the *MTConnect* Specification or Material.

If you intend to adopt or implement an *MTConnect* Specification or Material in a product, whether hardware, software or firmware, which complies with an *MTConnect* Specification, you shall agree to the *MTConnect* Specification Implementer License Agreement ("Implementer License") or to the *MTConnect* Intellectual Property Policy and Agreement ("IP Policy"). The Implementer License and IP Policy each sets forth the license terms and other terms of use for *MTConnect* Implementers to adopt or implement the *MTConnect* Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at www.MTConnect.org, or or by contacting mailto:info@MTConnect.org.

MTConnect Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect Institute have any obligation to secure any such rights.

This Material and all *MTConnect* Specifications and Materials are provided "as is" and *MTConnect* Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the *MTConnect* Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of noninfringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall *MTConnect* Institute or AMT be liable to any user or implementer of *MTConnect* Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the *MTConnect* Specification or other *MTConnect* Materials, whether or not they had advance notice of the possibility of such damage.

## 1 1 Purpose of This Document

- 2 This document, MTConnect Standard: Part 5.0 Interfaces of the MTConnect® Standard,
- 3 defines a structured data model used to organize information required to coordinate inter-
- 4 operations between pieces of equipment.
- 5 This data model is based on an *Interaction Model* that defines the exchange of information
- 6 between pieces of equipment and is organized in the MTConnect Standard as the XML
- 7 element Interfaces.
- 8 Interfaces is modeled as an extension to the MTConnectDevices and MTConnect-
- 9 Streams XML documents. Interfaces leverages similar rules and terminology as
- 10 those used to describe a component in the MTConnectDevices XML document. In-
- 11 terfaces also uses similar methods for reporting data to those used in the MTCon-
- 12 nectStreams XML document.
- 13 As defined in MTConnect Standard: Part 2.0 Devices Information Model, Interfaces
- is modeled as a Top Level component in the MTConnectDevices document (see Fig-
- 15 ure 3). Each individual Interface XML element is modeled as a Lower Level com-
- ponent of Interfaces. The data associated with each *Interface* is modeled within each
- 17 Lower Level component.
- Note: See MTConnect Standard: Part 2.0 Devices Information Model and MT-
- Connect Standard: Part 3.0 Streams Information Model of the MTConnect
- Standard for information on how *Interfaces* is structured in the XML docu-
- ments which are returned from an Agent in response to a probe, sample, or
- 22 current request.

## 23 **Terminology and Conventions**

- 24 Refer to Section 2 of MTConnect Standard Part 1.0 Overview and Fundamentals for a
- dictionary of terms, reserved language, and document conventions used in the MTConnect
- 26 Standard.

#### 27 2.1 Glossary

28 <b>CDAT</b>	A

- General meaning:
- An abbreviation for Character Data.
- CDATA is used to describe a value (text or data) published as part of an XML ele-
- 32 ment.
- For example, "This is some text" is the CDATA in the XML element:
- 34 <Message ...>This is some text</Message>
- Appears in the documents in the following form: CDATA
- 36 XML
- 37 Stands for eXtensible Markup Language.
- 38 XML defines a set of rules for encoding documents that both a human-readable and
- 39 machine-readable.
- XML is the language used for all code examples in the MTConnect Standard.
- Refer to http://www.w3.org/XML for more information about XML.

#### 42 Agent

- Refers to an MTConnect Agent.
- Software that collects data published from one or more piece(s) of equipment, orga-
- nizes that data in a structured manner, and responds to requests for data from client
- software systems by providing a structured response in the form of a *Response Doc-*
- 47 *ument* that is constructed using the *semantic data models* defined in the Standard.
- Appears in the documents in the following form: *Agent*.

#### 49 Child Element

- A portion of a data modeling structure that illustrates the relationship between an
- element and the higher-level *Parent Element* within which it is contained.
- Appears in the documents in the following form: *Child Element*.

#### 53 Component

- General meaning:
- A Structural Element that represents a physical or logical part or subpart of a piece of equipment.
- Appears in the documents in the following form: *Component*.
- 58 Used in *Information Models*:
- A data modeling element used to organize the data being retrieved from a piece of equipment.
- When used as an XML container to organize *Lower Level* Component elements.
- Appears in the documents in the following form: Components.
  - When used as an abstract XML element. Component is replaced in a data model by a type of *Component* element. Component is also an XML container used to organize *Lower Level* Component elements, *Data Entities*, or both.
  - Appears in the documents in the following form: Component.

#### 69 Controlled Vocabulary

- A restricted set of values that may be published as the *Valid Data Value* for a *Data*
- 71 *Entity*.

64 65

66

67

68

Appears in the documents in the following form: *Controlled Vocabulary*.

#### 73 Current Request

- A Current Request is a Request to an Agent to produce an MTConnectStreams Re-
- 75 sponse Document containing the Observations Information Model for a snapshot of
- the latest *observations* at the moment of the *Request* or at a given *sequence number*.

#### 77 Data Entity

- A primary data modeling element that represents all elements that either describe
- data items that may be reported by an *Agent* or the data items that contain the actual
- data published by an *Agent*.
- Appears in the documents in the following form: *Data Entity*.

#### 82 Devices Information Model

- A set of rules and terms that describes the physical and logical configuration for a piece of equipment and the data that may be reported by that equipment.
- Appears in the documents in the following form: *Devices Information Model*.

86	Element Name		
87 88	A descriptive identifier contained in both the start-tag and end-tag of an XML element that provides the name of the element.		
89	Appears in the documents in the following form: element name.		
90	Used to describe the name for a specific XML element:		
91 92			
93	Appears in the documents in the following form: <i>Element Name</i> .		
94	Equipment Metadata		
95			
96	Information Model		
97 98	The rules, relationships, and terminology that are used to define how information is structured.		
99 100 101	For example, an information model is used to define the structure for each <i>MTConnect Response Document</i> ; the definition of each piece of information within those documents and the relationship between pieces of information.		
102	Appears in the documents in the following form: Information Model.		
103	Interaction Model		
104 105			
106	Interface		
107	The means by which communication is achieved between independent systems.		
108	Lower Level		
109	A nested element that is below a higher level element.		
110	Metadata		
111	Data that provides information about other data.		
112	For example, Equipment Metadata defines both the Structural Elements that rep-		
113	resent the physical and logical parts and sub-parts of each piece of equipment, the		
114 115	relationships between those parts and sub-parts, and the definitions of the <i>Data Entities</i> associated with that piece of equipment.		
116	Appears in the documents in the following form: <i>Metadata</i> or <i>Equipment Metadata</i> .		

117	MTConnect Agent		
118	See definition for <i>Agent</i> .		
119	MTConnectDevices Response Document		
120 121	A Response Document published by an MTConnect Agent in response to a Probe Request.		
122	MTConnectStreams Response Document		
123 124	A Response Document published by an MTConnect Agent in response to a Current Request or a Sample Request.		
125	observation		
126	The observed value of a property at a point in time.		
127	Observations Information Model		
128 129	An Information Model that describes the Streaming Data reported by a piece of equipment.		
130	Parent Element		
131 132	An XML element used to organize <i>Lower Level</i> child elements that share a common relationship to the <i>Parent Element</i> .		
133	Appears in the documents in the following form: Parent Element.		
134	Probe Request		
135 136	A Probe Request is a Request to an Agent to produce an MTConnectDevices Response Document containing the Devices Information Model.		
137	Publish/Subscribe		
138 139 140 141 142	In the MTConnect Standard, a communications messaging pattern that may be used to publish <i>Streaming Data</i> from an <i>Agent</i> . When a <i>Publish/Subscribe</i> communication method is established between a client software application and an <i>Agent</i> , the <i>Agent</i> will repeatedly publish a specific MTConnectStreams document at a defined period.		
143	Appears in the documents in the following form: Publish/Subscribe.		
144	Request		
145 146	A communications method where a client software application transmits a message to an <i>Agent</i> . That message instructs the <i>Agent</i> to respond with specific information.		
147	Appears in the documents in the following form: <i>Request</i> .		

148	Requester		
149	An entity that initiates a <i>Request</i> for information in a communications exchange.		
150	Appears in the documents in the following form: Requester.		
151	Responder		
152	An entity that responds to a Request for information in a communications exchange.		
153	Appears in the documents in the following form: Responder.		
154	Response Document		
155 156	An electronic document published by an MTConnect Agent in response to a Probe Request, Current Request, Sample Request or Asset Request.		
157	Sample Request		
158 159 160	A Sample Request is a Request to an Agent to produce an MTConnectStreams Response Document containing the Observations Information Model for a set of timestamped observations made by Components.		
161	semantic data model		
162 163	A methodology for defining the structure and meaning for data in a specific logical way.		
164 165	It provides the rules for encoding electronic information such that it can be interpreted by a software system.		
166	Appears in the documents in the following form: semantic data model.		
167	sequence number		
168 169	The primary key identifier used to manage and locate a specific piece of <i>Streaming Data</i> in an <i>Agent</i> .		
170 171	sequence number is a monotonically increasing number within an instance of an Agent.		
172	Appears in the documents in the following form: sequence number.		
173	Streaming Data		
174 175	The values published by a piece of equipment for the <i>Data Entities</i> defined by the <i>Equipment Metadata</i> .		
176	Appears in the documents in the following form: Streaming Data.		
177	Structural Element		
178	General meaning:		

179 180	An XML element that organizes information that represents the physical and logical parts and sub-parts of a piece of equipment.		
181	Appears in the documents in the following form: Structural Element.		
182	Used to indicate hierarchy of Components:		
183 184	When used to describe a primary physical or logical construct within a piece of equipment.		
185	Appears in the de	ocuments in the following form: Top Level Structural Element.	
186 187		dicate a <i>Child Element</i> which provides additional detail describing ogical structure of a <i>Top Level Structural Element</i> .	
188	Appears in the de	ocuments in the following form: Lower Level Structural Element.	
189	Top Level		
190 191	-	ents that represent the most significant physical or logical functions ipment.	
192	Valid Data Value		
193 194	One or more acceptable values or constrained values that can be reported for a <i>Data Entity</i> .		
195	Appears in the documents in the following form: Valid Data Value(s).		
196	2.2 Acronyms		
197	AMT		
198	The Association for Manufacturing Technology		
199	2.3 MTConnect References		
200	[MTConnect Part 1.0]	MTConnect Standard Part 1.0 - Overview and Fundamentals. Version 1.8.0.	
202	[MTConnect Part 2.0]	MTConnect Standard: Part 2.0 - Devices Information Model. Version 1.8.0.	
204	[MTConnect Part 3.0]	MTConnect Standard: Part 3.0 - Streams Information Model. Version 1.8.0.	
206	[MTConnect Part 5 0]	MTConnect Standard: Part 5.0 - Interfaces, Version 1.8.0.	

#### 207 3 Interfaces Overview

- 208 In many manufacturing processes, multiple pieces of equipment must work together to
- 209 perform a task. The traditional method for coordinating the activities between individual
- 210 pieces of equipment is to connect them using a series of wires to communicate equipment
- 211 states and demands for action. These interactions use simple binary ON/OFF signals to
- 212 accomplished their intention.
- 213 In the MTConnect Standard, *Interfaces* provides a means to replace this traditional method
- 214 for interconnecting pieces of equipment with a structured *Interaction Model* that provides
- 215 a rich set of information used to coordinate the actions between pieces of equipment. Im-
- 216 plementers may utilize the information provided by this data model to (1) realize the inter-
- 217 action between pieces of equipment and (2) to extend the functionality of the equipment
- 218 to improve the overall performance of the manufacturing process.
- 219 The Interaction Model used to implement Interfaces provides a lightweight and efficient
- protocol, simplifies failure recovery scenarios, and defines a structure for implementing a
- 221 Plug-And-Play relationship between pieces of equipment. By standardizing the informa-
- 222 tion exchange using this higher-level semantic information model, an implementer may
- more readily replace a piece of equipment in a manufacturing system with any other piece
- of equipment capable of providing similar Interaction Model functions.
- 225 Two primary functions are required to implement the *Interaction Model* for an *Interfaces*
- and manage the flow of information between pieces of equipment. Each piece of equip-
- ment needs to have the following:
- An Agent which provides:
  - The data required to implement the *Interaction Model*.
- Any other data from a piece of equipment needed to implement the *Interface*
- 231 operating states of the equipment, position information, execution modes, process
- information, etc.

229

- A client software application that enables the piece of equipment to acquire and
- interpret information from another piece of equipment.

#### 235 3.1 Interfaces Architecture

- MTConnect Standard is based on a communications method that provides no direct way
- for one piece of equipment to change the state of or cause an action to occur in another

piece of equipment. The *Interaction Model* used to implement *Interfaces* is based on a *Publish/Subscribe* type of communications as described in *MTConnect Standard Part 1.0*- Overview and Fundamentals and utilizes a Request and Response information exchange mechanism. For *Interfaces*, pieces of equipment must perform both the publish (Agent) and subscribe (client) functions.

Note: The current definition of *Interfaces* addresses the interaction between two pieces of equipment. Future releases of the MTConnect Standard may address the interaction between multiple (more than two) pieces of equipment.

Figure 1 provides a high-level overview of a typical system architecture used to implement Interfaces.

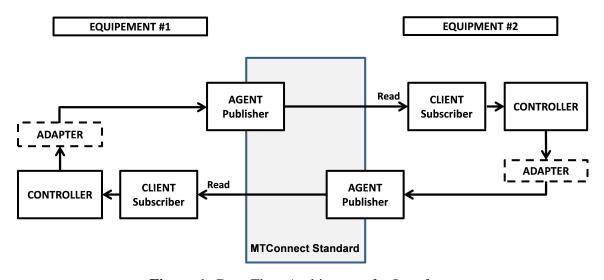

Figure 1: Data Flow Architecture for Interfaces

Note: The data flow architecture illustrated in *Figure 1* was historically referred to in the MTConnect Standard as a read-read concept.

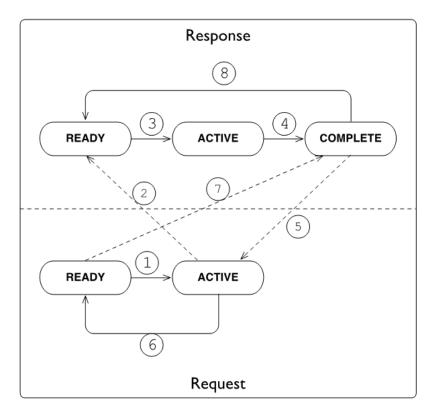

In the implementation of the *Interaction Model* for *Interfaces*, two pieces of equipment can exchange information in the following manner. One piece of equipment indicates a *Request* for service by publishing a type of *Request* using a data item provided through an *Agent* as defined in *Section 4 - Interfaces for Devices and Streams Information Models*. The client associated with the second piece of equipment, which is subscribing to data from the first machine, detects and interprets that *Request*. If the second machine chooses to take any action to fulfill this *Request*, it can indicate its acceptance by publishing a *Response* using a data item provided through its *Agent*. The client on the first piece of equipment continues to monitor information from the second piece of equipment until it detects an indication that the *Response* to the *Request* has been completed or has failed.

An example of this type of interaction between pieces of equipment can be represented

- by a machine tool that wants the material to be loaded by a robot. In this example, the
- machine tool is the *Requester*, and the robot is the *Responder*. On the other hand, if the
- 263 robot wants the machine tool to open a door, the robot becomes the Requester and the
- 264 machine tool the *Responder*.

#### 265 3.2 Request and Response Information Exchange

- The concept of a *Request* and *Response* information exchange is not unique to MTConnect
- 267 Interfaces. This style of communication is used in many different types of environments
- 268 and technologies.
- 269 An early version of a *Request* and *Response* information exchange was used by early
- 270 sailors. When it was necessary to communicate between two ships before radio com-
- 271 munications were available, or when secrecy was required, a sailor on each ship could
- communicate with the other using flags as a signaling device to request information or ac-
- 273 tions. The responding ship could acknowledge those requests for action and identify when
- 274 the requested actions were completed.
- The same basic *Request* and *Response* concept is implemented by MTConnect *Interfaces*
- 276 using the EVENT data items defined in Section 4 Interfaces for Devices and Streams
- 277 Information Models.
- The DataItem elements defined by the Interaction Model each have a Request and Re-
- sponse subtype. These subtypes identify if the data item represents a Request or a Re-
- 280 sponse. Using these data items, a piece of equipment changes the state of its Request or
- 281 Response to indicate information that can be read by the other piece of equipment. To
- 282 aid in understanding how the *Interaction Model* functions, one can view this *Interaction*
- 283 *Model* as a simple state machine.
- The interaction between two pieces of equipment can be described as follows. When the
- 285 Requester wants an activity to be performed, it transitions its Request state from a READY
- state to an ACTIVE state. In turn, when the client on the *Responder* reads this information
- and interprets the *Request*, the *Responder* announces that it is performing the requested
- task by changing its response state to ACTIVE. When the action is finished, the Responder
- changes its response state to COMPLETE. This pattern of *Request* and *Response* provides
- 290 the basis for the coordination of actions between pieces of equipment. These actions are
- 291 implemented using EVENT category data items. (See Section 4 Interfaces for Devices
- 292 and Streams Information Models for details on the Event type data items defined for
- 293 Interfaces.)
- Note: The implementation details of how the *Responder* piece of equipment reacts to
- the *Request* and then completes the requested task are up to the implementer.

296 Figure 2 provides an example of the Request and Response state machine:

Figure 2: Request and Response Overview

- The initial condition of both the *Request* and *Response* states on both pieces of equipment
- 298 is READY. The dotted lines indicate the on-going communications that occur to monitor
- 299 the progress of the interactions between the pieces of equipment.
- 300 The interaction between the pieces of equipment as illustrated in Figure 2 progresses
- 301 through the sequence in *Table 1*.

**Table 1:** Sequence of interaction between pieces of equipment

Step	Description	
1	The <i>Request</i> transitions from READY to ACTIVE signaling that a service is needed.	
2	The Response detects the transition of the Request.	
3	The <i>Response</i> transitions from READY to ACTIVE indicating that it is performing the action.	
4	Once the action has been performed, the <i>Response</i> transitions to COMPLETE.	

Continuation of Table 1			
Step	Description		
5	The <i>Request</i> detects the action is COMPLETE.		
6	The <i>Request</i> transitions back to READY acknowledging that the service has been performed.		
7	The <i>Response</i> detects the <i>Request</i> has returned to READY.		
8	In recognition of this acknowledgement, the <i>Response</i> transitions back to READY.		

After the final action has been completed, both pieces of equipment are back in the READY state indicating that they are able to perform another action.

#### 304 4 Interfaces for Devices and Streams Information Models

- 305 The *Interaction Model* for implementing *Interfaces* is defined in the MTConnect Standard
- 306 as an extension to the MTConnectDevices and MTConnectStreams XML docu-
- 307 ments.
- 308 A piece of equipment MAY support multiple different *Interfaces*. Each piece of equipment
- 309 supporting *Interfaces* MUST organize the information associated with each *Interface* in a
- 310 Top Level component called Interfaces. Each individual Interface is modeled as a Lower
- 311 Level component called Interface. Interface is an abstract type XML element and
- will be replaced in the XML documents by specific Interface types defined below. The
- data associated with each *Interface* is modeled as data items within each of these *Lower*
- 314 Level Interface components.
- The XML tree in Figure 3 illustrates where Interfaces is modeled in the Devices Informa-
- 316 tion Model for a piece of equipment.

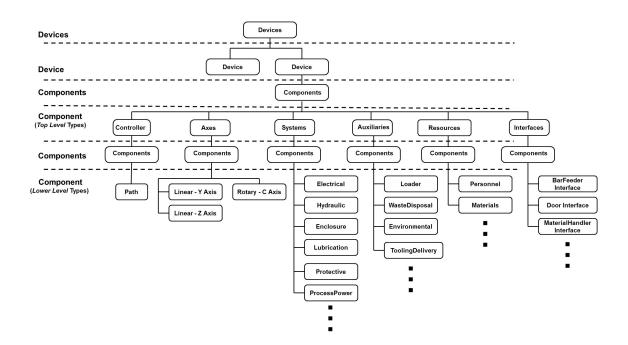

Figure 3: Interfaces as a Structural Element

#### 317 4.1 Interfaces

- 318 Interfaces is an XML Structural Element in the MTConnectDevices XML document.
- 319 Interfaces is a container type XML element. Interfaces is used to group information de-
- 320 scribing Lower Level Interface XML elements, which each provide information for
- 321 an individual Interface.
- 322 If the *Interfaces* container appears in the XML document, it MUST contain one or more
- 323 Interface type XML elements.

#### 324 4.2 Interface

- 325 Interface is the next level of Structural Element in the MTConnectDevices XML
- document. As an abstract type XML element, Interface will be replaced in the XML
- 327 documents by specific Interface types defined below.
- 328 Each Interface is also a container type element. As a container, the Interface
- 329 XML element is used to organize information required to implement the *Interaction Model*
- for an *Interface*. It also provides structure for describing the *Lower Level Structural Ele-*
- 331 ments associated with the Interface. Each Interface contains Data Entities avail-
- able from the piece of equipment that may be needed to coordinate activities with associ-
- 333 ated pieces of equipment.
- The information provided by a piece of equipment for each *Interface* is returned in a Com-
- 335 ponentStream container of an MTConnectStreams document in the same manner
- 336 as all other types of components.

#### 337 4.2.1 XML Schema Structure for Interface

- 338 The XML schema in Figure 4 represents the structure of an Interface XML element.
- The schema for an Interface element is the same as defined for Component elements
- 340 described in Section 4.4 in MTConnect Standard: Part 2.0 Devices Information Model
- of the MTConnect Standard. The Figure 4 shows the attributes defined for Interface
- and the elements that may be associated with Interface.

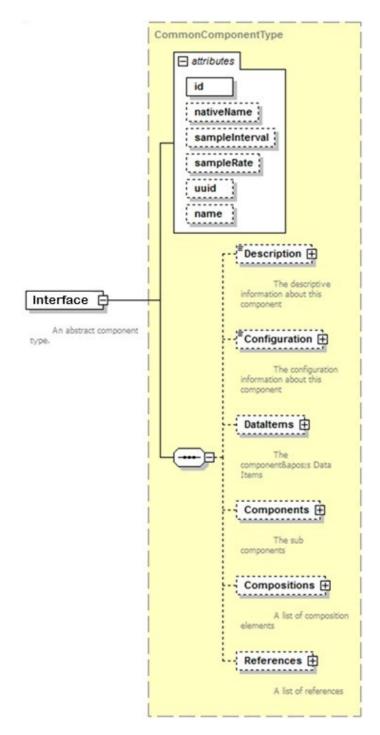

Figure 4: Interface Schema

- 343 Refer to MTConnect Standard: Part 2.0 Devices Information Model, Section 4.4 for
- 344 complete descriptions of the attributes and elements that are illustrated in the Figure 4 for
- 345 Interface.

### 346 4.2.2 Interface Types

- 347 As an abstract type XML element, Interface is replaced in the MTConnectDevices
- 348 document with a XML element representing a specific type of *Interface*. An initial list of
- 349 Interface types is defined in the Table 2.

**Table 2:** Interface types

Interface	Description
BarFeederInterface	BarFeederInterface provides the set of information used to coordinate the operations between a Bar Feeder and another piece of equipment.
	Bar Feeder is a piece of equipment that pushes bar stock (i.e., long pieces of material of various shapes) into an associated piece of equipment – most typically a lathe or turning center.

Conti	nuation of Table 2
Interface	Description
MaterialHandlerInterface	MaterialHandlerInterface provides the set of information used to coordinate the operations between a piece of equipment and another associated piece of equipment used to automatically handle various types of materials or services associated with the original piece of equipment.
	A material handler is a piece of equipment capable of providing any one, or more, of a variety of support services for another piece of equipment or a process:
	Loading/unloading material or tooling
	Part inspection
	Testing
	Cleaning
	Etc.
	A robot is a common example of a material handler.
DoorInterface	DoorInterface provides the set of information used to coordinate the operations between two pieces of equipment, one of which controls the operation of a door.
	The piece of equipment that is controlling the door MUST provide the data item  DOOR_STATE as part of the set of information provided.

Continuation of Table 2	
Interface	Description
ChuckInterface	ChuckInterface provides the set of information used to coordinate the operations between two pieces of equipment, one of which controls the operation of a chuck.  The piece of equipment that is controlling the chuck <b>MUST</b> provide the data item CHUCK_STATE as part of the set of information provided.

- Note: Additional Interface types may be defined in future releases of the MT-Connect Standard.
- In order to implement the *Interaction Model* for *Interfaces*, each piece of equipment as-
- 353 sociated with an *Interface MUST* provide an Interface XML element for that type of
- Interface. A piece of equipment MAY support any number of unique Interfaces.

#### 355 4.2.3 Data for Interface

- 356 Each Interface MUST provide (1) the data associated with the specific Interface to im-
- 357 plement the *Interaction Model* and (2) any additional data that may be needed by another
- piece of equipment to understand the operating states and conditions of the first piece of
- 359 equipment as it applies to the *Interface*.
- Details on data items specific to the *Interaction Model* for each type of *Interface* are pro-
- vided in Section 4.2.4 Data Items for Interface.
- An implementer may choose any other data available from a piece of equipment to describe
- the operating states and other information needed to support an *Interface*.

#### 4.2.3.1 References for Interface

364

- 365 Some of the data items needed to support a specific *Interface* may already be defined else-
- where in the XML document for a piece of equipment. However, the implementer may
- not be able to directly associate this data with the *Interface* since the MTConnect Standard
- does not permit multiple occurrences of a piece of data to be configured in a XML docu-
- ment. References provides a mechanism for associating information defined elsewhere

- in the *Information Model* for a piece of equipment with a specific *Interface*.
- 371 References is an XML container that organizes pointers to information defined else-
- where in the XML document for a piece of equipment. References MAY contain one
- 373 or more Reference XML elements.
- 374 Reference is an XML element that provides an individual pointer to information that is
- associated with another Structural Element or Data Entity defined elsewhere in the XML
- 376 document that is also required for an *Interface*.
- 377 References is an economical syntax for providing interface specific information with-
- out directly duplicating the occurrence of the data. It provides a mechanism to include all
- 379 necessary information required for interaction and deterministic information flow between
- 380 pieces of equipment.
- 381 For more information on the definition for References and Reference, see Section
- 382 4.7 and 4.8 of MTConnect Standard: Part 2.0 Devices Information Model.

#### 383 4.2.4 Data Items for Interface

- 384 Each Interface XML element contains data items which are used to communicate
- information required to execute the *Interface*. When these data items are read by another
- piece of equipment, that piece of equipment can then determine the actions that it may
- 387 take based upon that data.
- 388 Some data items MAY be directly associated with the Interface element and others
- will be organized in a Lower Level References XML element.
- 390 It is up to an implementer to determine which additional data items are required for a
- 391 particular Interface.
- 392 The data items that have been specifically defined to support the implementation of an
- 393 *Interface* are provided below.

#### 394 **4.2.4.1 INTERFACE\_STATE for Interface**

- 395 INTERFACE\_STATE is a data item specifically defined for Interfaces. It defines the
- operational state of the *Interface*. This is an indicator identifying whether the *Interface* is
- 397 functioning or not.
- 398 An INTERFACE\_STATE data item MUST be defined for every Interface XML ele-

- 399 ment.
- 400 INTERFACE\_STATE is reported in the MTConnectStreams XML document as In-
- 401 terfaceState. InterfaceState reports one of two states ENABLED or DIS-
- 402 ABLED, which are provided in the CDATA for InterfaceState.
- 403 The Table 3 shows both the INTERFACE STATE data item as defined in the MTCon-
- 404 nectDevices document and the corresponding *Element Name* that MUST be reported
- 405 in the MTConnectStreams document.

**Table 3:** InterfaceState Event

DataItem Type	Element Name	Description
INTERFACE_STATE	InterfaceState	The current functional or operational state of an Interface type element indicating whether the <i>Interface</i> is active or not currently functioning.
		Valid Data Values:
		ENABLED: The <i>Interface</i> is currently operational and performing as expected.
		DISABLED: The <i>Interface</i> is currently not operational.
		When the INTERFACE_STATE is DISABLED, the state of all data items that are specific for the <i>Interaction Model</i> associated with that <i>Interface</i> MUST be set to NOT_READY.

#### **96 4.2.4.2 Specific Data Items for the Interaction Model for Interface**

- 407 A special set of data items have been defined to be used in conjunction with Interface
- 408 type elements. When modeled in the MTConnectDevices document, these data items
- are all Data Entities in the EVENT category (See MTConnect Standard: Part 3.0 Streams
- 410 Information Model for details on how the corresponding data items are reported in the
- 411 MTConnectStreams document). They provide information from a piece of equipment
- 412 to Request a service to be performed by another associated piece of equipment; and for

- the associated piece of equipment to indicate its progress in performing its Response to the
- 414 Request for service.
- 415 Many of the data items describing the services associated with an *Interface* are paired to
- 416 describe two distinct actions one to *Request* an action to be performed and a second to
- 417 reverse the action or to return to an original state. For example, a DoorInterface will
- 418 have two actions OPEN\_DOOR and CLOSE\_DOOR. An example of an implementation of
- 419 this would be a robot that indicates to a machine that it would like to have a door opened
- 420 so that the robot could extract a part from the machine and then asks the machine to close
- that door once the part has been removed.
- When these data items are used to describe a service associated with an *Interface*, they
- 423 **MUST** have one of the following two subType elements: REQUEST or RESPONSE. These
- subType elements MUST be specified to define whether the piece of equipment is func-
- 425 tioning as the Requester or Responder for the service to be performed. The Requester
- 426 MUST specify the REQUEST subType for the data item and the Responder MUST specify
- a corresponding RESPONSE subType for the data item to enable the coordination between
- 428 the two pieces of equipment.
- 429 These data items and their associated subType provide the basic structure for implementing
- 430 the Interaction Model for an Interface.
- 431 Table 4 provides a list of the data items that have been defined to identify the services to
- be performed for or by a piece of equipment associated with an *Interface*.
- The Table 4 also provides the corresponding transformed Element Name for each data item
- 434 that MAY be returned by an Agent as an Event type XML Data Entity in the MTCon-
- 435 nectStreams XML document. The Controlled Vocabulary for each of these data items
- are defined in Section 4.2.4.3 Event States for Interfaces.

**Table 4:** Event Data Item types for Interface

DataItem Type	Element Name	Description
MATERIAL_FEED	MaterialFeed	Service to advance material or feed product to a piece of equipment from a continuous or bulk source.
MATERIAL_CHANGE	MaterialChange	Service to change the type of material or product being loaded or fed to a piece of equipment.
MATERIAL RETRACT	MaterialRetract	Service to remove or retract material or product.

Continuation of Table 4		
DataItem Type	Element Name	Description
PART_CHANGE	PartChange	Service to change the part or product associated with a piece of equipment to a different part or product.
MATERIAL_LOAD	MaterialLoad	Service to load a piece of material or product.
MATERIAL_UNLOAD	MaterialUnload	Service to unload a piece of material or product.
OPEN_DOOR	OpenDoor	Service to open a door.
CLOSE_DOOR	CloseDoor	Service to close a door.
OPEN_CHUCK	OpenChuck	Service to open a chuck.
CLOSE_CHUCK	CloseChuck	Service to close a chuck.

#### 437 **4.2.4.3 Event States for Interfaces**

- For each of the data items above, the Valid Data Values for the CDATA that is returned
- 439 for these data items in the MTConnectStreams document is defined by a Controlled
- 440 Vocabulary. This Controlled Vocabulary represents the state information to be communi-
- cated by a piece of equipment for the data items defined in the *Table 4*.
- The Request portion of the Interaction Model for Interfaces has four states as defined in
- 443 the *Table 5*.

**Table 5:** Request States

Request State	Description
NOT_READY	The Requester is not ready to make a Request.
READY	The <i>Requester</i> is prepared to make a <i>Request</i> , but no <i>Request</i> for service is required.
	The <i>Requester</i> will transition to ACTIVE when it needs a service to be performed.
ACTIVE	The <i>Requester</i> has initiated a <i>Request</i> for a service and the service has not yet been completed by the <i>Responder</i> .

Continuation of Table 5	
Request State	Description
FAIL	CONDITION 1:
	When the <i>Requester</i> has detected a failure condition, it indicates to the <i>Responder</i> to either not initiate an action or stop its action before it completes by changing its state to FAIL.
	CONDITION 2:
	If the <i>Responder</i> changes its state to FAIL, the <i>Requester</i> MUST change its state to FAIL.
	ACTIONS:
	After detecting a failure, the <i>Requester</i> SHOULD NOT change its state to any other value until the <i>Responder</i> has acknowledged the FAIL state by changing its state to FAIL.
	Once the FAIL state has been acknowledged by the <i>Responder</i> , the <i>Requester</i> may attempt to clear its FAIL state.
	As part of the attempt to clear the FAIL state, the <i>Requester</i> MUST reset any partial actions that were initiated and attempt to return to a condition where it is again ready to perform a service. If the recovery is successful, the <i>Requester</i> changes its <i>Request</i> state from FAIL to READY. If for some reason the <i>Requester</i> is not again prepared to perform a service, it transitions its state from FAIL to NOT_READY.

444 Figure 5 shows a graphical representation of the possible state transitions for a Request.

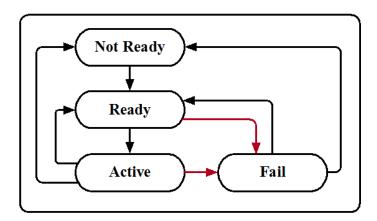

Figure 5: Request State Diagram

The *Response* portion of the *Interaction Model* for *Interfaces* has five states as defined in the *Table 6*.

 Table 6: Response States

Response State	Description
NOT_READY	The Responder is not ready to perform a service.
READY	The <i>Responder</i> is prepared to react to a Request, but no Request for service has been detected.
	The <i>Responder</i> <b>MUST</b> transition to ACTIVE to inform the <i>Requester</i> that it has detected and accepted the Request and is in the process of performing the requested service.
	If the <i>Responder</i> is not ready to perform a Request, it <b>MUST</b> transition to a NOT_READY state.
ACTIVE	The <i>Responder</i> has detected and accepted a Request for a service and is in the process of performing the service, but the service has not yet been completed.
	In normal operation, the <i>Responder</i> <b>MUST NOT</b> change its state to ACTIVE unless the <i>Requester</i> state is ACTIVE.

	Continuation of Table 6	
Response State	Description	
FAIL	CONDITION 1:	
	The <i>Responder</i> has failed while executing the actions required to perform a service and the service has not yet been completed or the <i>Responder</i> has detected that the <i>Requester</i> has unexpectedly changed state.	
	CONDITION 2:	
	If the <i>Requester</i> changes its state to FAIL, the <i>Responder</i> MUST change its state to FAIL.	
	ACTIONS:	
	After entering a FAIL state, the <i>Responder</i> SHOULD NOT change its state to any other value until the <i>Requester</i> has acknowledged the FAIL state by changing its state to FAIL.	
	Once the FAIL state has been acknowledged by the <i>Requester</i> , the <i>Responder</i> may attempt to clear its FAIL state.	
	As part of the attempt to clear the FAIL state, the <i>Responder</i> MUST reset any partial actions that were initiated and attempt to return to a condition where it is again ready to perform a service. If the recovery is successful, the <i>Responder</i> changes its <i>Response</i> state from FAIL to READY. If for some reason the <i>Responder</i> is not again prepared to perform a service, it transitions its state from FAIL to NOT_READY.	
COMPLETE	The <i>Responder</i> has completed the actions required to perform the service.	
	The <i>Responder</i> <b>MUST</b> remain in the COMPLETE state until the <i>Requester</i> acknowledges that the service is complete by changing its state to READY.	
	At that point, the <i>Responder</i> <b>MUST</b> change its state to either READY if it is again prepared to perform a service or NOT_READY if it is not prepared to perform a service.	

- The state values described in the *Table 6* and *Table 6* MUST be provided in the CDATA for each of the *Interface* specific data items provided in the MTConnectStreams document.
- 449 Figure 6 shows a graphical representation of the possible state transitions for a Response:

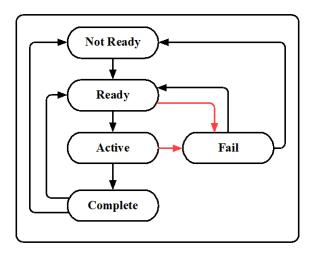

Figure 6: Response State Diagram

## **5 Operation and Error Recovery**

- The Request/Response state model implemented for Interfaces may also be represented by
- a graphical model. The scenario in Figure 7 demonstrates the state transitions that occur
- during a successful Request for service and the resulting Response to fulfill that service
- 454 Request.

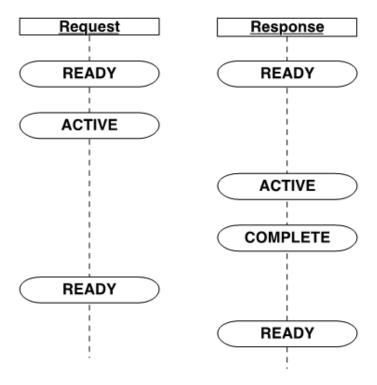

Figure 7: Success Scenario

### 455 5.1 Request/Response Failure Handling and Recovery

- 456 A significant feature of the Request/Response Interaction Model is the ability for either
- 457 piece of equipment to detect a failure associated with either the Request or Response ac-
- 458 tions. When either a failure or unexpected action occurs, the *Request* and the *Response*
- portion of the *Interaction Model* can announce a FAIL state upon detecting a problem. The
- following are graphical models describing multiple scenarios where either the *Requester*
- 1000 Tollowing are graphical models describing multiple sections where efficient the Requester
- or Responder detects and reacts to a failure. In these examples, either the Requester or Re-
- 462 *sponder* announces the detection of a failure by setting either the *Request* or the *Response*
- 463 state to FAIL.
- Once a failure is detected, the *Interaction Model* provides information from each piece of

- equipment as they attempt to recover from a failure, reset all of their functions associated
- with the *Interface* to their original state, and return to normal operation.
- The following are scenarios that describe how pieces of equipment may react to different
- 468 types of failures and how they indicate when they are again ready to request a service or
- respond to a request for service after recovering from those failures:

#### 470 Scenario #1 – *Responder* Fails Immediately

- In this scenario, a failure is detected by the Responder immediately after a Request for
- service has been initiated by the *Requester*.

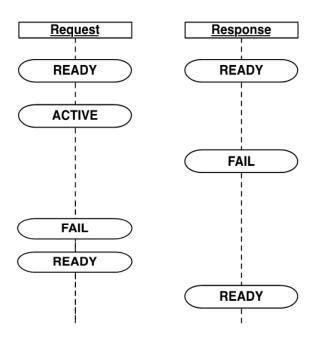

Figure 8: Responder - Immediate Failure

- 473 In this case, the *Request* transitions to ACTIVE and the *Responder* immediately detects
- 474 a failure before it can transition the *Response* state to ACTIVE. When this occurs, the
- 475 *Responder* transitions the *Response* state to FAIL.
- 476 After detecting that the *Responder* has transitioned its state to FAIL, the *Requester* MUST
- 477 change its state to FAIL.
- 478 The Requester, as part of clearing a failure, resets any partial actions that were initiated
- and attempts to return to a condition where it is again ready to request a service. If the
- 480 recovery is successful, the *Requester* changes its state from FAIL to READY. If for some
- 481 reason the Requester cannot return to a condition where it is again ready to request a
- 482 service, it transitions its state from FAIL to NOT READY.

- The Responder, as part of clearing a failure, resets any partial actions that were initiated
- and attempts to return to a condition where it is again ready to perform a service. If the
- 485 recovery is successful, the *Responder* changes its *Response* state from FAIL to READY. If
- 486 for some reason the *Responder* is not again prepared to perform a service, it transitions its
- 487 state from FAIL to NOT\_READY.

#### Scenario #2 – Responder Fails While Providing a Service

- This is the most common failure scenario. In this case, the Responder will begin the
- 490 actions required to provide a service. During these actions, the *Responder* detects a failure
- and transitions its *Response* state to FAIL.

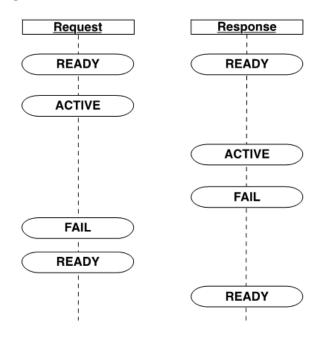

Figure 9: Responder Fails While Providing a Service

- 492 When a Requester detects a failure of a Responder, it transitions it state from ACTIVE to
- 493 FAIL.
- 494 The Requester resets any partial actions that were initiated and attempts to return to a
- 495 condition where it is again ready to request a service. If the recovery is successful, the
- 496 Requester changes its state from FAIL to READY if the failure has been cleared and it is
- again prepared to request another service. If for some reason the *Requester* cannot return
- 498 to a condition where it is again ready to request a service, it transitions its state from FAIL
- 499 to NOT\_READY.
- The Responder, as part of clearing a failure, resets any partial actions that were initiated
- and attempts to return to a condition where it is again ready to perform a service. If the
- recovery is successful, the Responder changes its Response state from FAIL to READY if

it is again prepared to perform a service. If for some reason the *Responder* is not again prepared to perform a service, it transitions its state from FAIL to NOT READY.

#### Scenario #3 – Requester Failure During a Service Request

505

In this scenario, the *Responder* will begin the actions required to provide a service. During these actions, the *Requester* detects a failure and transitions its *Request* state to FAIL.

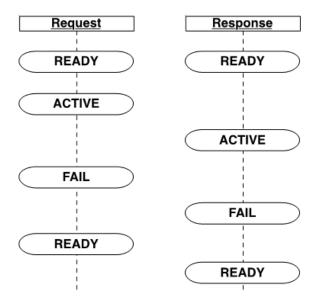

Figure 10: Requester Fails During a Service Request

- When the *Responder* detects that the *Requester* has transitioned its *Request* state to FAIL, the *Responder* also transitions its *Response* state to FAIL.
- 510 The Requester, as part of clearing a failure, resets any partial actions that were initiated
- and attempts to return to a condition where it is again ready to request a service. If the
- recovery is successful, the *Requester* changes its state from FAIL to READY. If for some
- reason the Requester cannot return to a condition where it is again ready to request a
- 514 service, it transitions its state from FAIL to NOT\_READY.
- 515 The Responder, as part of clearing a failure, resets any partial actions that were initiated
- and attempts to return to a condition where it is again ready to perform a service. If the
- 517 recovery is successful, the *Responder* changes its *Response* state from FAIL to READY. If
- for some reason the *Responder* is not again prepared to perform a service, it transitions its
- 519 state from FAIL to NOT READY.
- Scenario #4 Requester Changes to an Unexpected State While Responder is Providing
   a Service
- In some cases, a Requester may transition to an unexpected state after it has initiated a

- 523 *Request* for service.
- As demonstrated in Figure 11, the Requester has initiated a Request for service and its
- Request state has been changed to ACTIVE. The Responder begins the actions required to
- 526 provide the service. During these actions, the *Requester* transitions its *Request* state back
- 527 to READY before the *Responder* can complete its actions. This **SHOULD** be regarded as
- 528 a failure of the *Requester*.

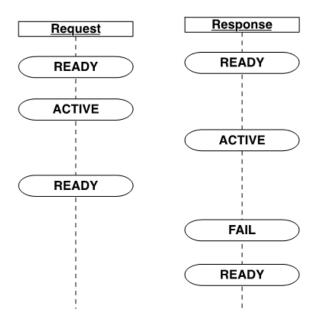

Figure 11: Requester Makes Unexpected State Change

- In this case, the *Responder* reacts to this change of state of the *Requester* in the same way
- as though the Requester had transitioned its Request state to FAIL (i.e., the same as in
- 531 Scenario #3 above).
- 532 At this point, the *Responder* then transitions its *Response* state to FAIL.
- 533 The Responder resets any partial actions that were initiated and attempts to return to its
- original condition where it is again ready to perform a service. If the recovery is successful,
- 535 the Responder changes its Response state from FAIL to READY. If for some reason the
- 736 Responder is not again prepared to perform a service, it transitions its state from FAIL to
- 537 NOT\_READY.
- Note: The same scenario exists if the *Requester* transitions its *Request* state to NOT\_READY. However, in this case, the *Requester* then transitions its *Request* state
  to READY after it resets all of its functions back to a condition where it is again
- 541 prepared to make a *Request* for service.

#### Scenario #5 – Responder Changes to an Unexpected State While Providing a Service

- 543 Similar to Scenario #5, a *Responder* may transition to an unexpected state while providing
- 544 a service.

542

- As demonstrated in Figure 12, the Responder is performing the actions to provide a ser-
- vice and the *Response* state is ACTIVE. During these actions, the *Responder* transitions its
- 547 state to NOT\_READY before completing its actions. This should be regarded as a failure
- 548 of the Responder.

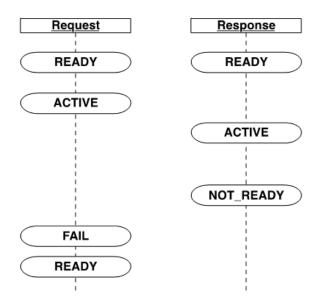

Figure 12: Responder Makes Unexpected State Change

- 549 Upon detecting an unexpected state change of the *Responder*, the *Requester* transitions its
- 550 state to FAIL.
- The Requester resets any partial actions that were initiated and attempts to return to a
- 552 condition where it is again ready to request a service. If the recovery is successful, the
- 753 Requester changes its state from FAIL to READY. If for some reason the Requester cannot
- return to a condition where it is again ready to request a service, it transitions its state from
- 555 FAIL to NOT\_READY.
- Since the Responder has failed to an invalid state, the condition of the Responder is un-
- 557 known. Where possible, the *Responder* should try to reset to an initial state.
- The Responder, as part of clearing the cause for the change to the unexpected state, should
- 559 attempt to reset any partial actions that were initiated and then return to a condition where
- 560 it is again ready to perform a service. If the recovery is successful, the *Responder* changes
- its Response state from the unexpected state to READY. If for some reason the Responder

is not again prepared to perform a service, it maintains its state as NOT\_READY.

Scenario #6 – Responder or Requester Become UNAVAILABLE or Experience a Loss of Communications

In this scenario, a failure occurs in the communications connection between the *Responder* and *Requester*. This failure may result from the InterfaceState from either piece of equipment returning a value of UNAVAILABLE or one of the pieces of equipment does not provide a heartbeat within the desired amount of time (See *MTConnect Standard Part* 1.0 - Overview and Fundamentals for details on heartbeat).

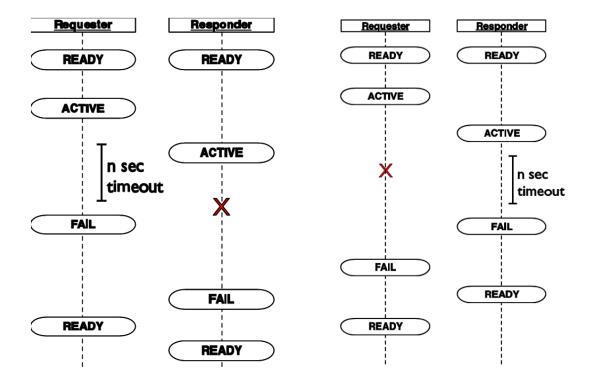

Figure 13: Requester/Responder Communication Failures

- When one of these situations occurs, each piece of equipment assumes that there has been a failure of the other piece of equipment.
- When normal communications are re-established, neither piece of equipment should as-
- sume that the Request/Response state of the other piece of equipment remains valid. Both
- 574 pieces of equipment should set their state to FAIL.
- The Requester, as part of clearing its FAIL state, resets any partial actions that were
- 576 initiated and attempts to return to a condition where it is again ready to request a service.
- If the recovery is successful, the *Requester* changes its state from FAIL to READY. If for
- some reason the *Requester* cannot return to a condition where it is again ready to request

- a service, it transitions its state from FAIL to NOT\_READY.
- The Responder, as part of clearing its FAIL state, resets any partial actions that were
- initiated and attempts to return to a condition where it is again ready to perform a service.
- 582 If the recovery is successful, the Responder changes its Response state from FAIL to
- 583 READY. If for some reason the Responder is not again prepared to perform a service, it
- 584 transitions its state from FAIL to NOT READY.
