AgCl

Lunar caustic

Silver chloride

H₂SO₄

Oil of vitriol

Sulfuric acid

MgSO₄

Epsom salts

Magnesium sulfate

Nonenclature

When naming chemical compounds we distinguish between

Organic compounds

- **compounds containing carbon.**

Exceptions: CO , CO_2 , CS_2 , CN^- , CO_3^{2-} , HCO_3^- , H_2CO_3

Inorganic compounds

- **all other compounds**

we can break the naming of inorganic compounds into four categories:

Ionic compounds

Molecular compounds

Acids and Bases

Hydrates

Binary compounds contain two different elements

Examples: NaCl, FeBr₃, Al₂O₃, N₂O₅, P₄O₁₀

Instead of concerning ourselves with whether the compound is ionic or molecular, let's reintroduce the idea of electronegativity.

Electronegativity

measure of an elements ability to attract electrons toward itself when bonded to another element

An electronegative element attracts electrons.

An electropositive element releases electrons.

decreasing
electronegativity

Increasing electronegativity

Group	1	2		3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

Naming Ionic Compounds

Naming binary compounds

binary compounds contain two elements

and are named as two words

first word is name of cation

second word is first part of name of anion followed by -ide

Examples of binary compounds of metals

sodium bromide:

calcium oxide:

barium chloride:

aluminum oxide:

number of positive charges must equal number of negative charges

Writing Formulas

© 2012 Pearson Education, Inc.

- Because compounds are electrically neutral, one can determine the formula of a compound this way:
 - The charge on the cation becomes the subscript on the anion.
 - The charge on the anion becomes the subscript on the cation.
 - If these subscripts are not in the lowest whole-number ratio, divide them by the greatest common factor.

Common Cations

TABLE 2.4 • Common Cations*

Charge	Formula	Name	Formula	Name
1+	H⁺	hydrogen ion	NH₄⁺	ammonium ion
	Li ⁺	lithium ion	Cu ⁺	copper(I) or cuprous ion
	Na⁺	sodium ion		
	K⁺	potassium ion		
	Cs ⁺	cesium ion		
	Ag⁺	silver ion		
2+	Mg²⁺	magnesium ion	Co ²⁺	cobalt(II) or cobaltous ion
	Ca²⁺	calcium ion	Cu²⁺	copper(II) or cupric ion
	Sr ²⁺	strontium ion	Fe²⁺	iron(II) or ferrous ion
	Ba ²⁺	barium ion	Mn ²⁺	manganese(II) or manganous ion
	Zn²⁺	zinc ion	Hg ₂ ²⁺	mercury(I) or mercurous ion
	Cd ²⁺	cadmium ion	Hg²⁺	mercury(II) or mercuric ion
			Ni ²⁺	nickel(II) or nickelous ion
			Pb²⁺	lead(II) or plumbous ion
			Sn ²⁺	tin(II) or stannous ion
3+	Al³⁺	aluminum ion	Cr ³⁺	chromium(III) or chromic ion
			Fe³⁺	iron(III) or ferric ion

*The ions we use most often in this course are in boldface. Learn them first.

© 2012 Pearson Education, Inc.

Common Anions

TABLE 2.5 • Common Anions*

Charge	Formula	Name	Formula	Name
1−	H [−]	hydride ion	CH₃COO[−] (or C ₂ H ₃ O ₂ [−])	acetate ion
	F[−]	fluoride ion	ClO ₃ [−]	chlorate ion
	Cl[−]	chloride ion	ClO₄[−]	perchlorate ion
	Br[−]	bromide ion	NO₃[−]	nitrate ion
	I[−]	iodide ion	MnO ₄ [−]	permanganate ion
	CN [−]	cyanide ion		
	OH[−]	hydroxide ion		
2−	O^{2−}	oxide ion	CO₃^{2−}	carbonate ion
	O ₂ ^{2−}	peroxide ion	CrO ₄ ^{2−}	chromate ion
	S^{2−}	sulfide ion	Cr ₂ O ₇ ^{2−}	dichromate ion
			SO₄^{2−}	sulfate ion
3−	N^{3−}	nitride ion	PO₄^{3−}	phosphate ion

*The ions we use most often are in boldface. Learn them first.

Example

Write the formulas for the following compounds:

(a) potassium sulfide

Answer: K_2S

Example

But some metals can form more than one type of cation

Often, but not always, a transition metal

Binary compounds of metals (cont'd)

When metal can form more than one type of cation, indicate charge by Roman numeral in parenthesis

MnO manganese(II) oxide

Mn₂O₃ manganese(III) oxide

MnO₂ manganese(IV) oxide

use of the suffixes -ous and -ic is discouraged

Commonly encountered cations that can exist as two different charge types

+1, +2: Cu, Hg

+2, +3: Fe, Co

+2, +4: Sn, Pb

Example

Write the formulas for the following compounds:

(a) tin(II) fluoride

Answer: SnF_2

Example

Write the formulas for the following compounds:

(a) mercury(II) oxide

Answer: HgO

Example

Write the formulas for the following compounds:

(a) mercury(I) iodide

Hg⁺ actually exists as Hg₂²⁺

I⁻

Answer: Hg₂I₂

Polyatomic Ions

molecules with a charge

Polyatomic Ions

carbonate

chromate

hydroxide

nitrate

dichromate

chlorate

bromate

Iodate

peroxide

acetate

Example

Name the following ionic compounds:

Answer: copper(II)nitrate

Naming Molecular Compounds

Molecular Compounds

Electrons are shared by the atoms.

Covalent Bonds

Electrons however are not shared equally.

Molecular Compounds

Elements that are more electronegative
assume an **apparent negative charge (δ^-)**.

Elements that are more electropositive
assume an **apparent positive charge (δ^+)**.

naming binary compounds of nonmetals

- 1) more electropositive element named first
(and listed first in chemical formula)
- 2) more electronegative element named in usual
way (with -ide suffix)
- 3) **counting prefixes** are used with each name
but mono is not used with first name

Greek prefixes used in naming molecular compounds

Prefix	Meaning	Prefix	Meaning
Mono-	1	Hexa-	6
Di-	2	Hepta-	7
Tri-	3	Octa-	8
Tetra-	4	Nona-	9
Penta-	5	Deca-	10

Examples

CO	carbon monoxide
CO ₂	carbon dioxide
SO ₂	sulfur dioxide
SO ₃	sulfur trioxide
PCl ₃	phosphorus trichloride
PCl ₅	phosphorus pentachloride
NO ₂	nitrogen dioxide
N ₂ O ₄	dinitrogen tetroxide
Cl ₂ O ₇	dichlorine heptoxide

Name the following compounds

chlorine trifluoride

sulfur dichloride

dichlorine heptoxide

Naming Acids and Bases

Acids and Bases

An acid is a substance that yields hydrogen ions (H^+) when dissolved in water.

Acids that contain hydrogen, oxygen, and another element are called oxyacids.

Acids and Bases

Bases are substances that yield hydroxide Ions (HO^-) when dissolved in water.

NaOH , KOH , $\text{Ba}(\text{OH})_2$, NH_3

Naming Acids

Naming an acid depends on whether the anion contains oxygen

If the anion does not contain oxygen the acid is named with the prefix *hydro* and the suffix *--ic*

If the anion contains oxygen the acid name is formed from the root name of the anion with the suffix *-ic or -ous*

Names for some binary acids

Anion

Corresponding Acid

F^- (fluoride)

HF (hydrofluoric acid)

Cl^- (chloride)

HCl (hydrochloric acid)

Br^- (bromide)

HBr (hydrobromic acid)

I^- (iodide)

HI (hydroiodic acid)

CN^- (cyanide)

HCN (hydrocyanic acid)

S^{2-} (sulfide)

H_2S (hydrosulfuric acid)

Polyatomic anions

sulfite SO_3^{2-}

sulfate SO_4^{2-}

hypochlorite ClO^-

chlorite ClO_2^-

chlorate ClO_3^-

perchlorate ClO_4^-

Ternary acids

three element acids

most ternary acids are oxyacids containing hydrogen, oxygen, and one other element

Oxyacids

acetate anion

acetic acid

Oxyacids

sulfite	SO_3^{2-}	sulfurous acid	H_2SO_3 HOSOOH
sulfate	SO_4^{2-}	sulfuric acid	H_2SO_4 HOSO₂OH

Oxyacids

perchlorate	ClO_4^-	perchloric acid	HClO_4 HOClO_3
-------------	------------------	-----------------	-------------------------------------

Addition of one O atom

chlorate	ClO_3^-	chloric acid	HClO_3 HOClO_2
----------	------------------	--------------	-------------------------------------

removal of one O atom

chlorite	ClO_2^-	chlorous acid	HClO_2 HOClO
----------	------------------	---------------	-----------------------------------

removal of two O atoms

hypochlorite	ClO^-	hypochlorous acid	HOCl
--------------	----------------	-------------------	---------------

Hydrates

Compounds that have a specific number of water molecules attached to them

Copper(II) sulfate pentahydrate

Copper(II) sulfate anhydrous

Anhydrous - the water molecules have been driven off by heating

Nomenclature of Organic Compounds

Methane

Ethane

Propane

© 2012 Pearson Education, Inc.

- **Organic chemistry** is the study of carbon.
- Organic chemistry has its own system of nomenclature.

Nomenclature of Organic Compounds

Methane

Ethane

Propane

© 2012 Pearson Education, Inc.

The simplest hydrocarbons (compounds containing only carbon and hydrogen) are **alkanes**.

Nomenclature of Organic Compounds

Methane

Ethane

Propane

© 2012 Pearson Education, Inc.

The first part of the names just listed correspond to the number of carbons (***meth-*** = 1, ***eth-*** = 2, ***prop-*** = 3, etc.).

Nomenclature of Organic Compounds

Methanol

Ethanol

1-Propanol

© 2012 Pearson Education, Inc.

- When a hydrogen in an alkane is replaced with something else (a **functional group**, like -OH in the compounds above), the name is derived from the name of the alkane.
- The ending denotes the type of compound.
 - An **alcohol** ends in -ol.

Polyatomic anions

hydroxide

peroxide

acetate
