Automation

NETWORK AUTOMATION WORKSHOP

Introduction to Ansible for network engineers and operators

Housekeeping

- Timing
- Breaks
- Takeaways

What You Will Learn

Ansible is capable of handling many powerful automation tasks with the flexibility to adapt to many environments and workflows.

- What is Ansible, its common use cases
- How Ansible works and terminology
- Network modules
 - Backup and Restore network devices
 - Self documenting networks
- Using roles
- Ansible Tower

**MANAGING NETWORKS
HASN'T CHANGED
IN 30 YEARS.**

According to Gartner

CLI on individual devices

Percentage of Respondents

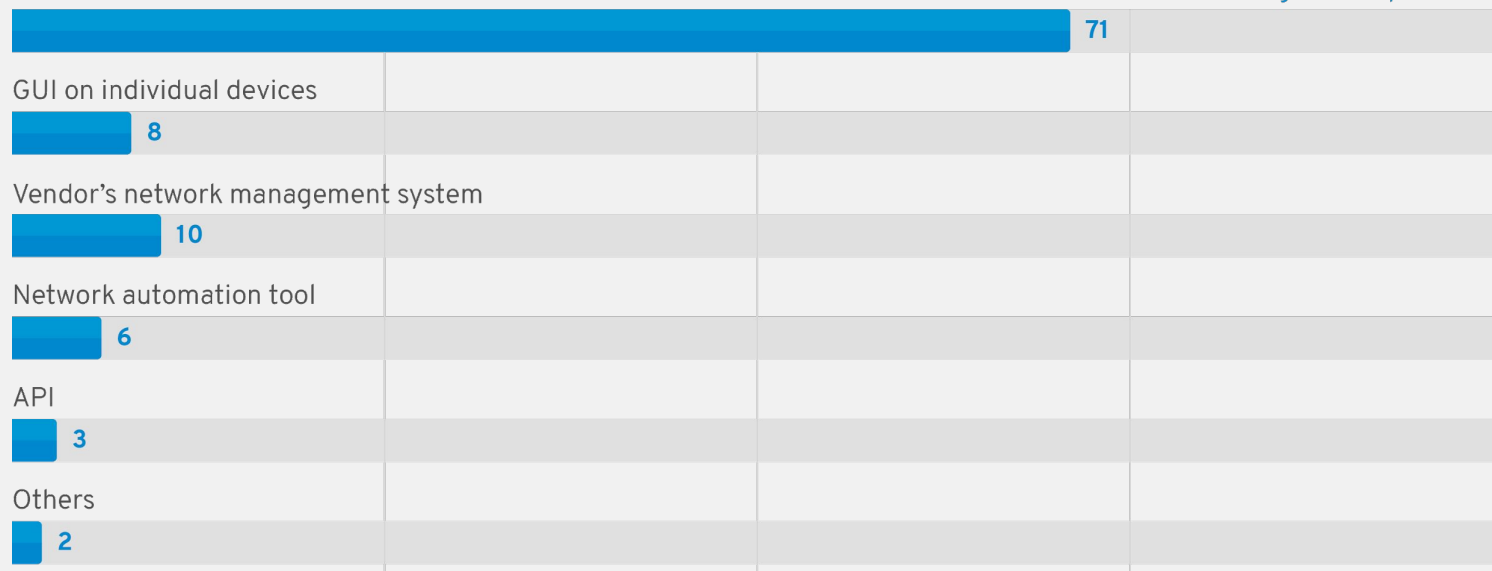

Figure 1

Primary Method for Making Network Changes

Source: Gartner, *Look Beyond Network Vendors for Network Innovation*. January 2018. Gartner ID: G00349636. (n=64)

Automation considerations

- Compute is no longer the slowest link in the chain
- Businesses demand that networks deliver at the speed of cloud
- Automation of repeatable tasks
- Bridge silos

WHAT IS ANSIBLE AUTOMATION?

Ansible Automation is the enterprise **framework** for automating across IT operations.

Ansible Engine runs Ansible Playbooks, the automation **language** that can perfectly describe an IT application infrastructure.

Ansible Tower allows you **scale** IT automation, manage complex deployments and speed productivity.

WHY ANSIBLE?

SIMPLE

- Human readable automation
- No special coding skills needed
- Tasks executed in order
- Usable by every team
- Get productive quickly**

POWERFUL

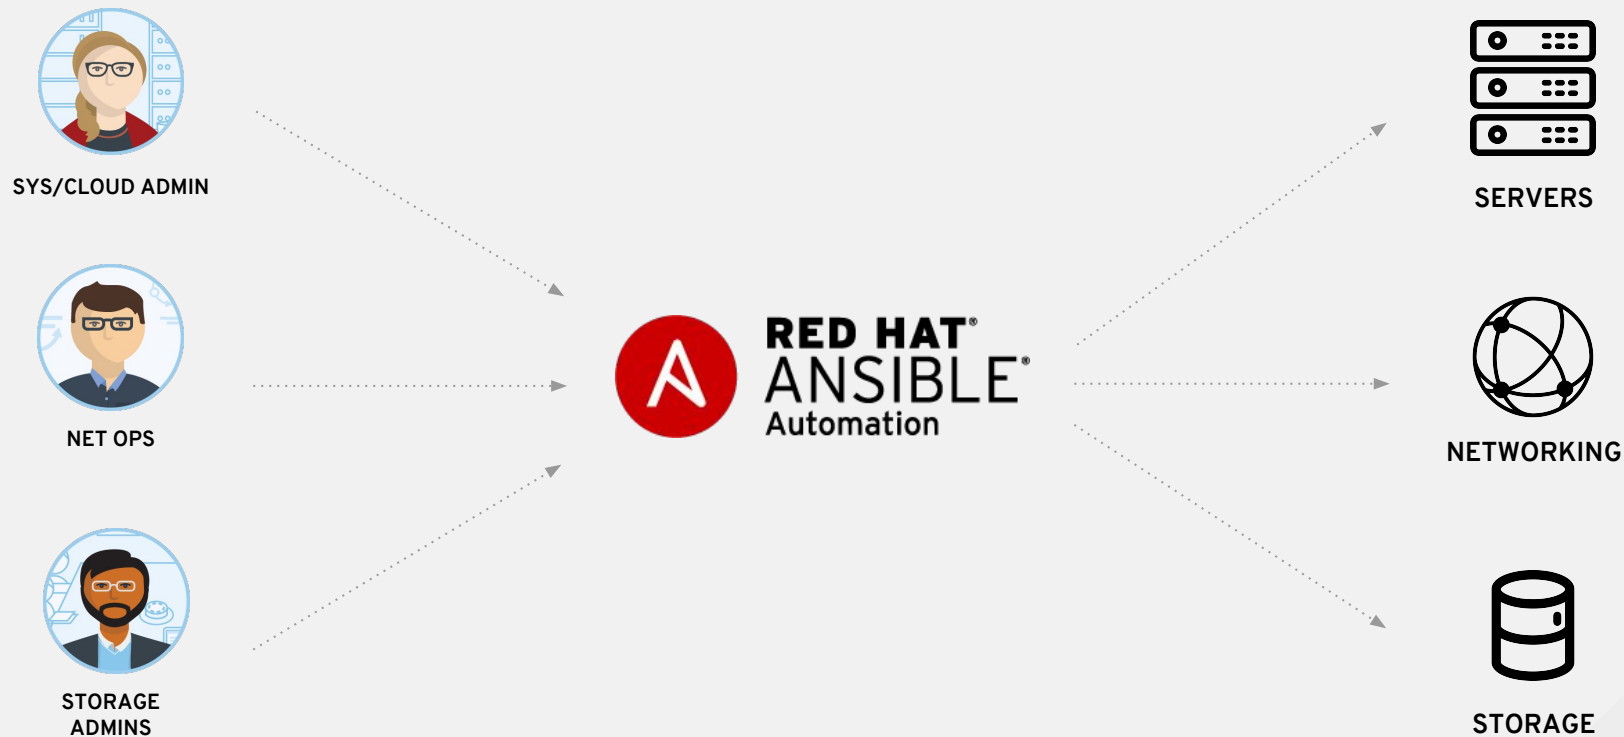

- App deployment
- Configuration management
- Workflow orchestration
- Network automation
- Orchestrate the app lifecycle**

AGENTLESS

- Agentless architecture
- Uses OpenSSH & WinRM
- No agents to exploit or update
- Get started immediately
- More efficient & more secure**

MANAGE YOUR ENTIRE ENTERPRISE

ANSIBLE NETWORK AUTOMATION

50

Network
Platforms

700+

Network
Modules

12*

Galaxy
Network Roles

ansible.com/networking
galaxy.ansible.com/ansible-network

Ansible Network modules comprise 1/3 of all modules that ship with Ansible Engine

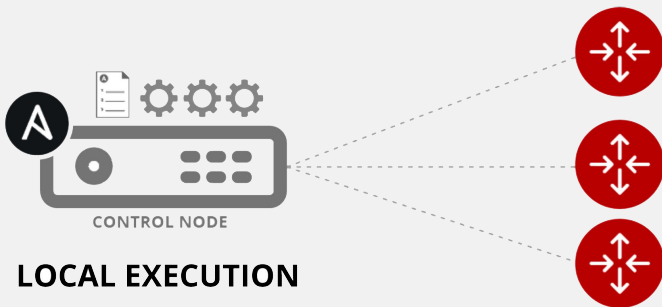

Common use cases

- Backup and restore device configurations
- Upgrade network device OS
- Ensure configuration compliance
- Apply patches to address CVE
- Generate dynamic documentation
- Discrete Tasks
 - Ensure VLANs are present/absent
 - Enable/Disable netflow on WAN interfaces
 - Manage firewall access list entries

Basically anything an operator can do manually, Ansible can automate.

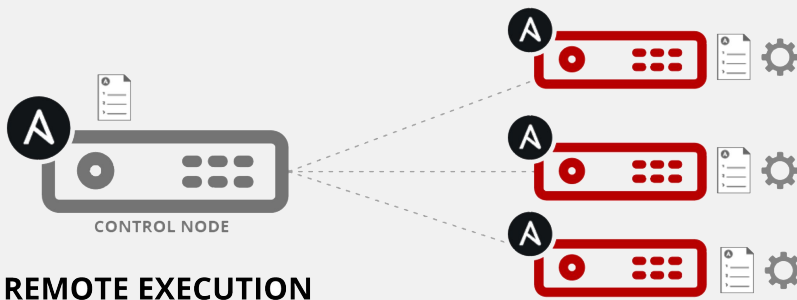

How Ansible Works

Module code is executed locally on the control node

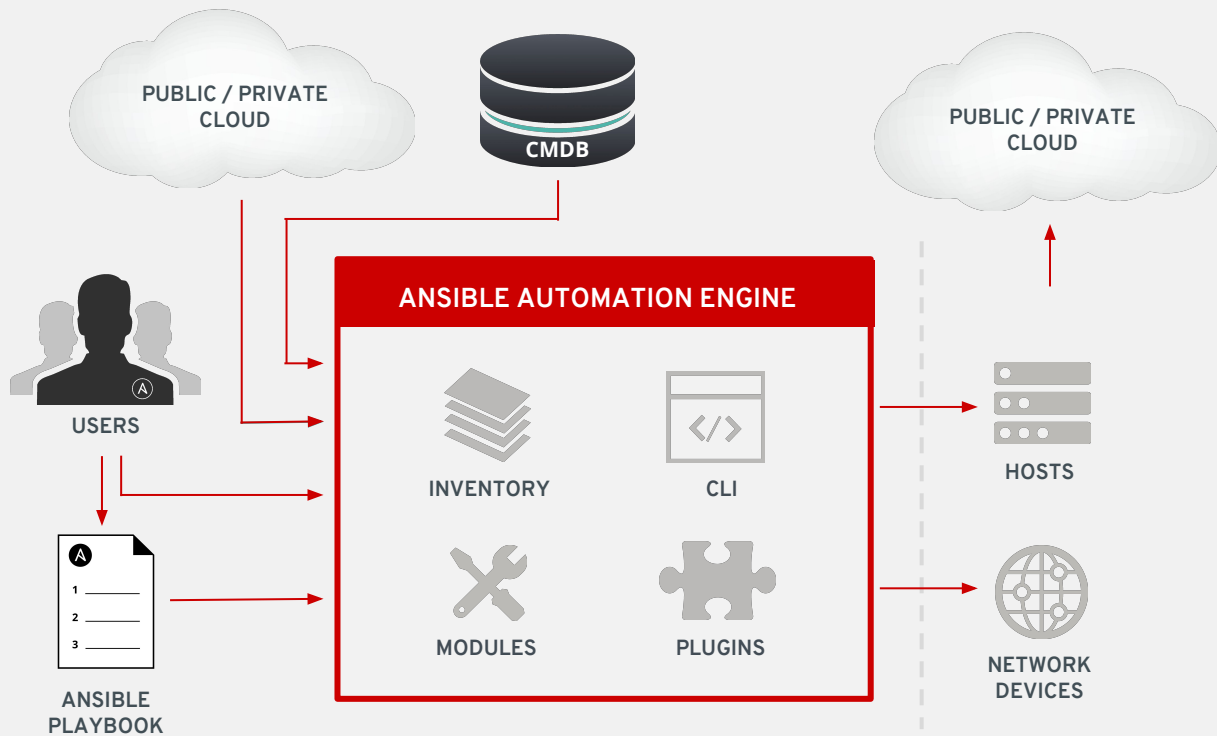

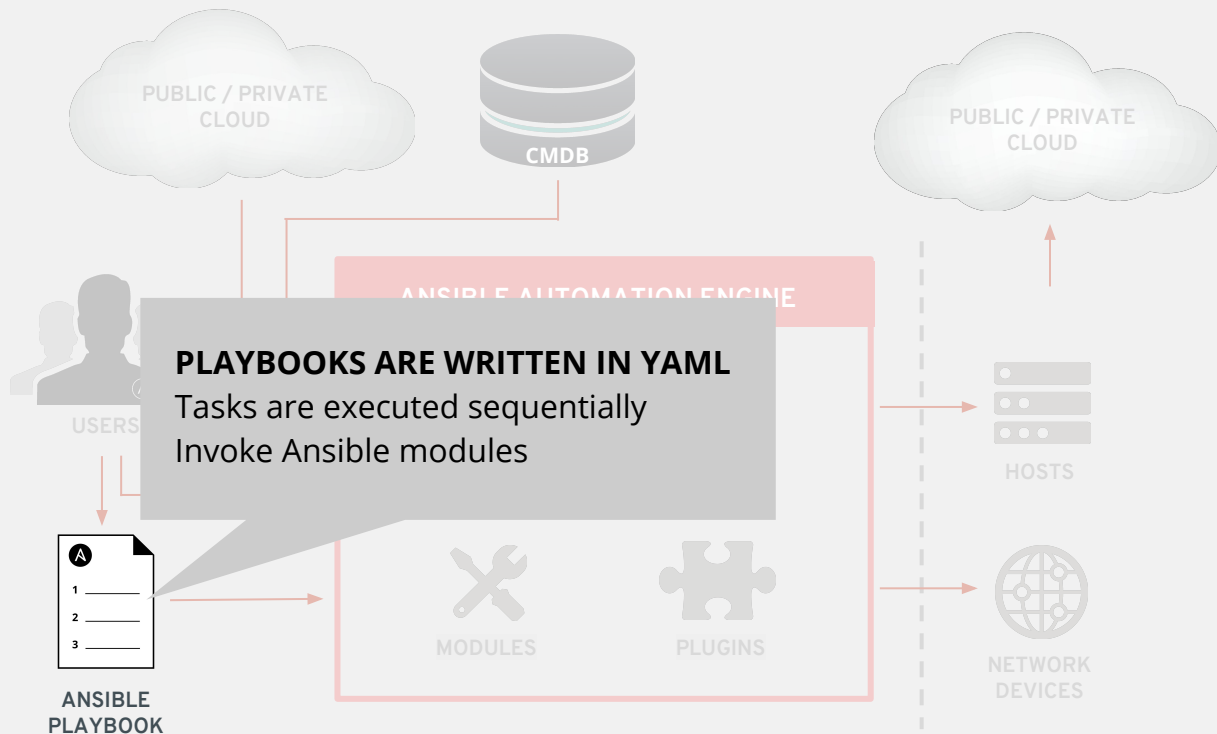

**NETWORKING
DEVICES**

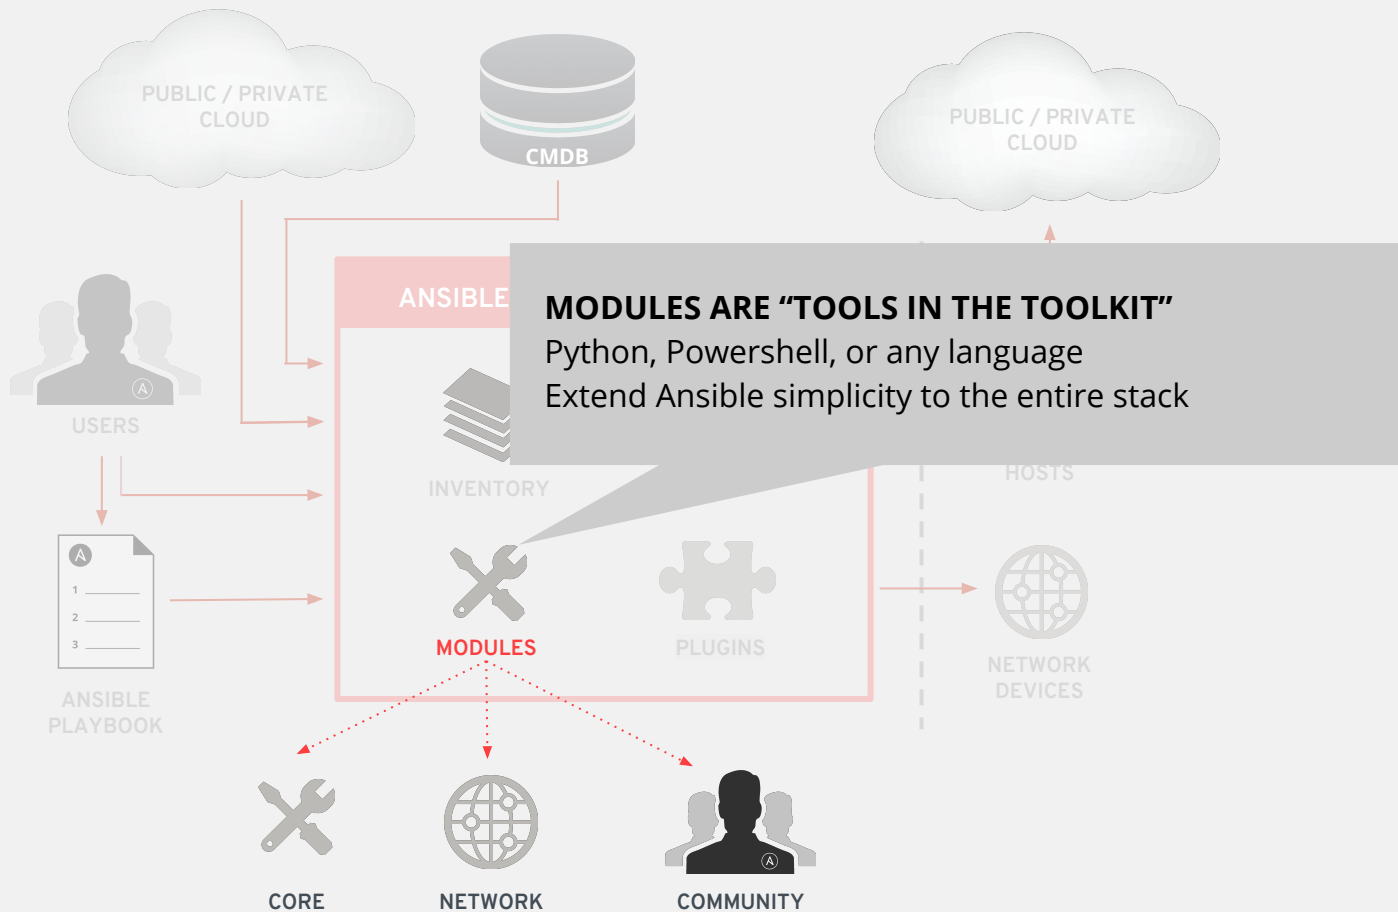

Module code is copied to the managed node, executed, then removed

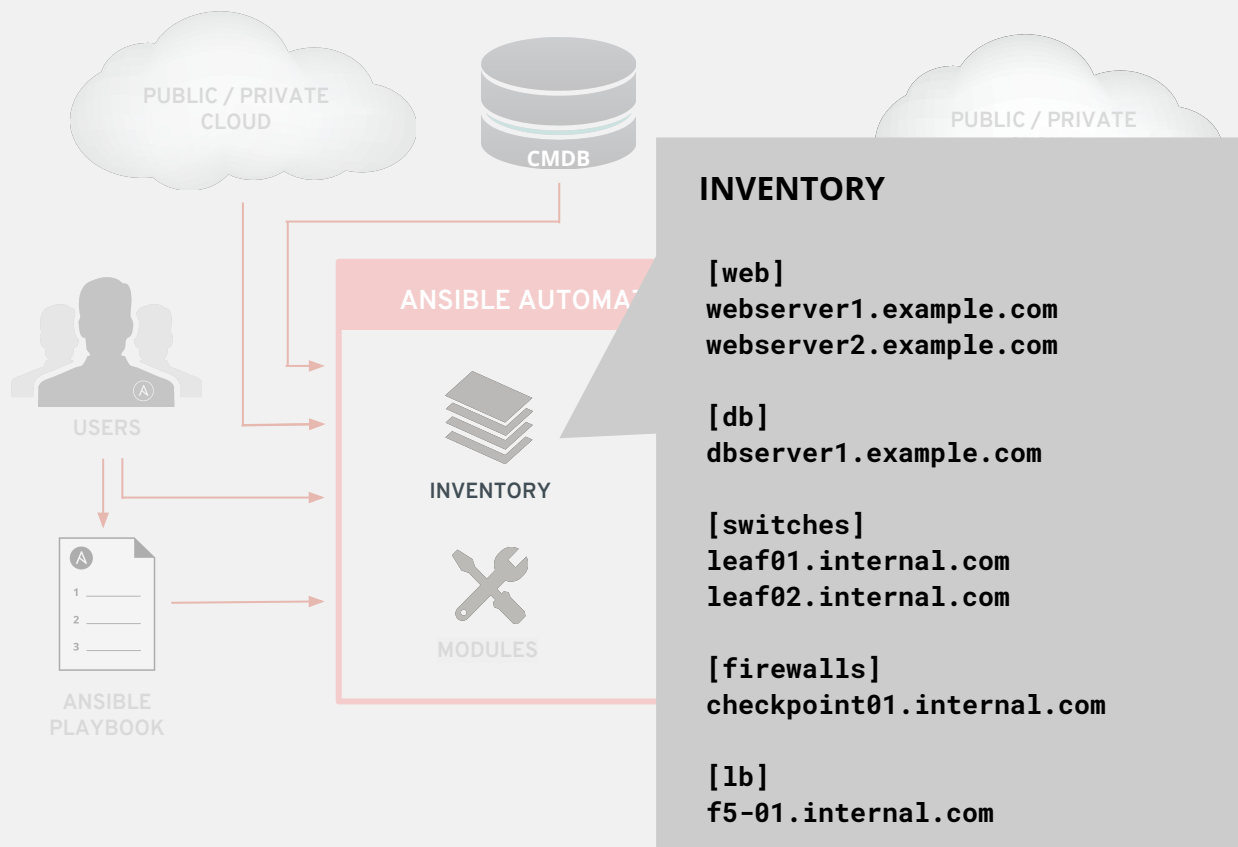

**LINUX/WINDOWS
HOSTS**

Understanding Inventory

```
10.1.1.2  
10.1.1.3  
172.16.1.1  
172.16.1.2  
192.168.1.2  
192.168.1.3
```

Understanding Inventory - Groups

There is always a group called "all" by default

```
[atl]
access1.atl.com ansible_host=10.1.1.2
access2.atl.com ansible_host=192.168.1.2

[core]
core1.nw.com
core2.nw.com

[access]
access1.nw.com
access2.nw.com
```

Groups can be nested

```
[DC:children]
core
access

[east-coast:children]
DC
atl

[atl]
access1.atl.com ansible_host=10.1.1.2
access2.atl.com ansible_host=192.168.1.2

[core]
core1.nw.com
core2.nw.com

[access]
access1.nw.com
access2.nw.com
```

Inventory - variables

```
[all:vars]
ansible_username=admin
ansible_password=pa55w0rd
snmp_ro=public123
snmp_rw=private123

[east-coast:vars]
ntp_server=10.99.99.99
anycast=169.1.1.1

[DC:children]
core
access

[east-coast:children]
DC
atl

[atl]
access1.atl.com ansible_host=10.1.1.2 snmp_ro=atl123
access2.atl.com ansible_host=192.168.1.2

[core]
core1.nw.com snmp_ro=corepub123 snmp_rw=corepri123
core2.nw.com
```

Group variables apply for all devices in that group

Host variables apply to the host and override group vars

A Sample Playbook

```
---
- name: DEPLOY VLANS
  hosts: access
  connection: network_cli
  gather_facts: no

  tasks:
    - name: ENSURE VLANS EXIST
      nxos_vlan:
        vlan_id: 100
        admin_state: up
        name: WEB
```

- Playbook is a list of plays.
- Each play is a list of tasks.
- Tasks invoke modules.
- A playbook can contain more than one play.

RED HAT
ANSIBLE
Engine

10:00

Exercise 1.0

Exploring the lab environment

In this lab you will explore the lab environment and build familiarity with the lab inventory.

Approximate time: 10 mins

Playbook definition for network automation

- Target play execution using **hosts**
- Define the connection : **network_cli**
- About **gather_facts**

Running a playbook

```
---
- name: GATHER INFORMATION FROM ROUTERS
  hosts: cisco
  connection: network_cli
  gather_facts: no

  tasks:
    - name: GATHER ROUTER FACTS
      ios_facts:
```

```
[student1@control-node networking-workshop]$ ansible-playbook gather_ios_data.yml
```

```
PLAY [GATHER INFORMATION FROM ROUTERS] *****
```

```
TASK [GATHER ROUTER FACTS] *****
```

```
ok: [rtr1]
```

```
ok: [rtr4]
```

```
ok: [rtr3]
```

```
ok: [rtr2]
```

```
PLAY RECAP *****
```

```
rtr1 : ok=1 changed=0 unreachable=0 failed=0
```

```
rtr2 : ok=1 changed=0 unreachable=0 failed=0
```

```
rtr3 : ok=1 changed=0 unreachable=0 failed=0
```

```
rtr4 : ok=1 changed=0 unreachable=0 failed=0
```

```
[student1@ip-172-16-101-121 networking-workshop]$
```

Displaying output

Use the optional **verbose** flag during playbook execution

```
student1@control-node networking-workshop]$ ansible-playbook gather_ios_data.yml -v
Using /home/student1/.ansible.cfg as config file
```

```
PLAY [GATHER INFORMATION FROM ROUTERS] *****
```

```
TASK [GATHER ROUTER FACTS] *****
```

```
ok: [rtr3] => {"ansible_facts": {"ansible_net_all_ipv4_addresses": ["10.100.100.3", "192.168.3.103", "172.16.235.46",
"192.168.35.101", "10.3.3.103"], "ansible_net_all_ipv6_addresses": [], "ansible_net_filesystems": ["bootflash:"],
"ansible_net_gather_subset": ["hardware", "default", "interfaces"], "ansible_net_hostname": "rtr3", "ansible_net_image":
"boot:packages.conf", "ansible_net_interfaces": {"GigabitEthernet1": {"bandwidth": 1000000, "description": null, "duplex": "Full",
"ipv4": [{"address": "172.16.235.46", "subnet": "16"}], "lineprotocol": "up", "macaddress": "0e93.7710.e63c", "mediatype": "Virtua
"mtu": 1500, "operstatus": "up", "type": "CSR vNIC"}, "Loopback0": {"bandwidth": 8000000, "description": null, "duplex": null, "ipv4": [{"address": "10.3.3.103",
"subnet": "24"}], "lineprotocol": "up", "macaddress": "10.3.3.103/24", "mediatype": null, "mtu": 1514, "operstatus": "up", "type":
"Tunnel0": {"bandwidth": 100, "description": null, "duplex": null, "ipv4": [{"address": "10.100.100.3", "subnet": "24"}]
.
```

```
.
```

```
<output truncated for readability>
```

Increase the level of verbosity by adding more "v's" -vvvv

Limiting Playbook execution

Playbook execution can be limited to a subset of devices using the `--limit` flag.

```
$ ansible-playbook gather_ios_data.yml -v --limit rtr1
```

Forget a flag / option ?
Just type `ansible-playbook` then press enter

A note about variables

Other than the user defined variables, Ansible supports many inbuilt variables. For example:

Variable	Explanation
<code>ansible_*</code>	Output of fact gathering
<code>inventory_hostname</code>	magic inbuilt variable that is the name of the host as defined in inventory
<code>hostvars</code>	magic inbuilt variable dictionary variable whose key is <code>inventory_hostname</code> e.g. <code>hostvars[webserver1].my_variable</code>

Displaying output - The “debug” module

The **debug** module is used like a "print" statement in most programming languages. Variables are accessed using "{ { } }" - quoted curly braces

RED HAT
ANSIBLE
Engine

10:00

Exercise 1.1

Writing your first playbook

In this lab you will write your first playbook and run it to gather facts from routers. You will also practice the use of "verbose" and "limit" flags in addition to working with variables within a playbook.

Approximate time: 10 mins

Modules

Modules do the actual work in Ansible, they are what gets executed in each playbook task.

- Typically written in Python (but not limited to it)
- Modules can be idempotent
- Modules take user input in the form of parameters

Network modules

Ansible modules for network automation typically references the vendor OS followed by the module name.

- *_facts
- *_command
- *_config

More modules depending on platform

Arista EOS = eos_*

Cisco IOS/IOS-XE = ios_*

Cisco NX-OS = nxos_*

Cisco IOS-XR = iosxr_*

F5 BIG-IP = bigip_*

F5 BIG-IQ = bigiq_*

Juniper Junos = junos_*

VyOS = vyos_*

Modules per network platform

```
tasks:
  - name: configure eos system properties
    eos_system:
      domain_name: ansible.com
      vrf: management
    when: ansible_network_os == 'eos'

  - name: configure nxos system properties
    nxos_system:
      domain_name: ansible.com
      vrf: management
    when: ansible_network_os == 'nxos'
```

service - Manage services.

- [Synopsis](#)
- [Options](#)
- [Examples](#)
- [Status](#)
- [Support](#)

Synopsis

- Controls services on remote hosts. Supported init systems include BSD init, OpenRC, SysV, Solaris SMF, systemd, upstart.

Options

parameter	required	default	choices	comments
arguments	no			Additional arguments provided on the command line
enabled	no		<ul style="list-style-type: none">• yes• no	Whether the service should start on boot. At least one of state and enabled are required.
name	yes			Name of the service.
pattern	no			If the service does not respond to the status command, name a substring to look for as would be found in the output of the ps command as a stand-in for a status result. If the string is found, the service will be assumed to be running.
runlevel	no	default		For OpenRC init scripts (see Gentoo) only. The runlevel that this service belongs to.
sleep (added in 1.3)	no			If the service is being restarted then sleep this many seconds between the stop and start command. This helps to workaround badly behaving init scripts that exit immediately after signaling a process to stop.
state	no		<ul style="list-style-type: none">• started• stopped• restarted• reloaded	started / stopped are idempotent actions that will not run commands unless necessary. restarted will always bounce the service. reload will always reload. At least one of state and enabled are required. Note that reloaded will start the service if it is not already started, even if your chosen init system wouldn't normally.
use (added in 2.2)	no	auto		The service module actually uses system specific modules, normally through auto detection, this setting can force a specific module. Normally it uses the value of the ansible_service_mgr fact and falls back to the old 'service' module when none matching is found.

Modules Documentation

Documentation right on the command line

```
# List out all modules installed
$ ansible-doc -l
...
ios_banner           Manage multiline banners on Cisco IOS devices
ios_command          Run commands on remote devices running Cisco IOS
ios_config           Manage Cisco IOS configuration sections
...

# Read documentation for installed module
$ ansible-doc ios_command
> IOS_COMMAND

Sends arbitrary commands to an ios node and returns the results read from the
device. This module includes an argument that will cause the module to wait for a
specific condition before returning or timing out if the condition is not met. This
module does not support running commands in configuration mode. Please use
[ios_config] to configure IOS devices.

Options (= is mandatory):
...
```

Limiting tasks within a play

- Tags allow the user to selectively execute tasks within a play.
- Multiple tags can be associated with a given task.
- Tags can also be applied to entire plays or roles.

```
- name: DISPLAY THE COMMAND OUTPUT
  debug:
    var: show_output
  tags: show
```

Tags are invoked using the `--tags` flag while running the playbook

```
[user@ansible]$ ansible-playbook gather_ios_data.yml --tags=show
```

This is useful while working with large playbooks, when you might want to "jump" to a specific task.

Limiting tasks within a play - or skip them!

- `--skip-tags` allows you to skip everything

```
- name: DISPLAY THE COMMAND OUTPUT
  debug:
    var: show_output
  tags: show
```

```
[user@ansible]$ ansible-playbook gather_ios_data.yml --skip-tags=show
```

Registering the output

The **register** parameter is used to collect the output of a task execution. The output of the task is 'registered' in a variable which can then be used for subsequent tasks.

```
- name: COLLECT OUTPUT OF SHOW COMMANDS
  ios_command:
    commands:
      - show run | i hostname
      - show ip interface brief
  tags: show
  register: show_output
```

Exercise 1.2

Module documentation, Registering output & tags

In this lab you will learn how to use module documentation. You will also learn how to selectively run tasks using tags and learn how to collect task output into user defined variables within the playbook.

Approximate time: 15 mins

The *_config module

Vendor specific config modules allow the user to update the configuration on network devices. Different ways to invoke the *_config module:

```
tasks:
  - name: ENSURE THAT THE DESIRED SNMP STRINGS ARE PRESENT
    ios_config:
      commands:
        - snmp-server community ansible-public RO
        - snmp-server community ansible-private RW
        - snmp-server community ansible-test RO
```

```
tasks:
  - name: ENSURE THAT ROUTERS ARE SECURE
    ios_config:
      src: secure_router.cfg
```

Validating changes before they are applied

Ansible lets you validate the impact of the proposed configuration using the **--check** flag. Used together with the **--verbose** flag, it lets you see the actual change being pushed to the device:

```
[student1@control-node networking-workshop]$ ansible-playbook router_configs.yml --check -v
Using /home/student1/.ansible.cfg as config file

PLAY [UPDATE THE SNMP RO/RW STRINGS] *****

TASK [ENSURE THAT THE DESIRED SNMP STRINGS ARE PRESENT] *****
changed: [rtr3] => {"banners": {}, "changed": true, "commands": ["snmp-server community ansible-test RO"],
"updates": ["snmp-server community ansible-test RO"]}
```

Exercise 2.0

Updating the router configurations

In this lab you will learn how to make configuration changes using Ansible. The exercise will demonstrate the idempotency of the module. Additionally you will learn how to validate a change before actually applying it to the devices.

Approximate time: 20 mins

RED HAT
ANSIBLE
Engine

Scenario: Day 2 Ops - Backing up and restoring router configuration

Backing up router configuration

The backup parameter of the `ios_config` module triggers the backup and automatically stores device configuration backups within a **backups** directory

```
---  
- name: BACKUP ROUTER CONFIGURATIONS  
  hosts: cisco  
  connection: network_cli  
  gather_facts: no  
  
  tasks:  
    - name: BACKUP THE CONFIG  
      ios_config:  
        backup: yes  
        register: config_output
```

Cleaning up the backed up configuration

The backed up configuration has 2 lines that should be removed:

```
Building configuration...
```

```
Current configuration with default configurations exposed : 393416 bytes
```

The **lineinfile** module is a general purpose module that is used for manipulating file contents.

Cleaning up (cont'd)

Cleaning up an exact line match:

```
- name: REMOVE NON CONFIG LINES
  lineinfile:
    path: "./backup/{{inventory_hostname}}.config"
    line: "Building configuration..."
    state: absent
```

Cleaning up (cont'd)

Matching using a regular expression:

```
- name: REMOVE NON CONFIG LINES - REGEXP
  lineinfile:
    path: "./backup/{{inventory_hostname}}.config"
    regexp: 'Current configuration.*'
    state: absent
```

Restoring the configuration

If any out of band changes were made to the device and it needs to be restored to the last known good configuration, we could take the following approach:

- Copy over the cleaned up configuration to the devices
- Use vendor provided commands to restore the device configuration

*In our example we use the Cisco IOS command **config replace**. This allows for applying only the differences between running and the copied configuration

Restoring (cont'd)

```
---
- name: RESTORE CONFIGURATION
  hosts: cisco
  connection: network_cli
  gather_facts: no

  tasks:
    - name: COPY RUNNING CONFIG TO ROUTER
      command: scp ./backup/{{inventory_hostname}}.config {{inventory_hostname}}:/{{inventory_hostname}}.config

    - name: CONFIG REPLACE
      ios_command:
        commands:
          - config replace flash:{{inventory_hostname}}.config force
```

Note the use of `inventory_hostname` to effect host specific changes

Exercise 2.1 & 2.2

Backup & Restore router configuration

In this lab you will implement a typical Day 2 Ops scenario of backing up and restoring device configurations.

Approximate time: 20 mins

RED HAT
ANSIBLE
Engine

Scenario: Creating living/dynamic documentation

Templates

- Ansible has native integration with the Jinja2 templating engine
- Render data models into device configurations
- Render device output into dynamic documentation

Jinja2 enables the user to manipulate variables, apply conditional logic and extend programmability for network automation.

Using templates to generate configuration

Data model:

```
vlangs:  
- id: 10  
  name: WEB  
- id: 20  
  name: APP  
- id: 30  
  name: DB
```

Jinja2 template

```
{% for vlan in vlans %}  
vlan {{ vlan.id }}  
  name {{ vlan.name }}  
{% endfor %}
```

Tying it all together

```
- name: RENDER THE VLAN CONFIGURATION  
  template:  
    src: vlans.j2  
    dest: "vlan_configs/{{ inventory_hostname }}.conf"
```

leaf1.conf

```
vlan 10  
  name WEB  
vlan 20  
  name APP  
vlan 30  
  name DB
```

Using templates to build dynamic documentation

```
{{ inventory_hostname.upper() }}  
---  
{{ ansible_net_serialnum }} : {{ ansible_net_version }}
```

```
RTR1  
---  
9YJXS2VD3Q7 : 16.08.01a
```

```
RTR2  
---  
9QHUCH0VZI9 : 16.08.01a
```

```
RTR3  
---  
9ZGJ5B1DL14 : 16.08.01a
```

```
RTR4  
---  
9TCM27U9TQG : 16.08.01a
```

- Generate documentation that never goes stale
- Build troubleshooting reports
- Same data to generate exec reports and engineering reports using different templates

Assembling the data

The **assemble** module is used to generate a consolidated file by combining fragments. This is a common strategy used to put snippets together into a final document.

```
- name: CONSOLIDATE THE IOS DATA
  assemble:
    src: reports/
    dest: network_os_report.md
    delegate_to: localhost
    run_once: yes
```

```
RTR1
---
9YJXS2VD3Q7 : 16.08.01a

RTR2
---
9QHUCH0VZI9 : 16.08.01a

RTR3
---
9ZGJ5B1DL14 : 16.08.01a
RTR4
---
9TCM27U9TQG : 16.08.01a
```

RED HAT
ANSIBLE
Engine

15:00

Exercise 3.0

An introduction to templating

In this lab you will use a basic Jinja2 template to generate a markdown report that contains the device name, serial number and operating system version. You will create a report per device and then use the assemble module to consolidate them.

Approximate time: 15 mins

A quick introduction to roles

The 2 basic files required to get started with Ansible are:

- Inventory
- Playbook

Roles

Roles are Playbooks

- Roles help simplify playbooks.
- Think of them as callable functions for repeated tasks.
- Roles can be distributed/shared; similar to libraries.

Example Playbook

```
# site.yml
---
- hosts: DC
  roles:
    - ntp
    - vlan
```

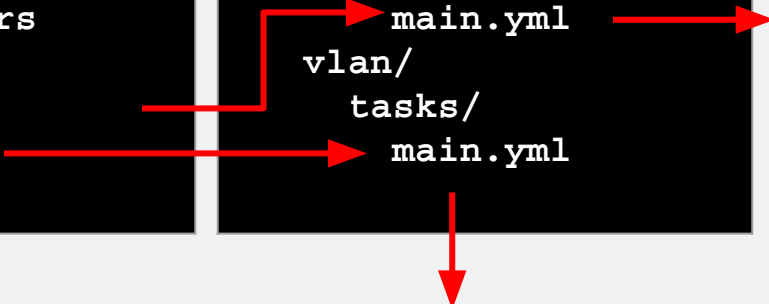

Directory Structure

```
site.yml
roles/
  ntp/
    tasks/
      main.yml
  vlan/
    tasks/
      main.yml
```

Roles - really simple, but powerful

```
# site.yml
---
- hosts: routers
  roles:
    - ntp
    - vlan
```

```
ntp/
  tasks/
    main.yml
vlan/
  tasks/
    main.yml
```

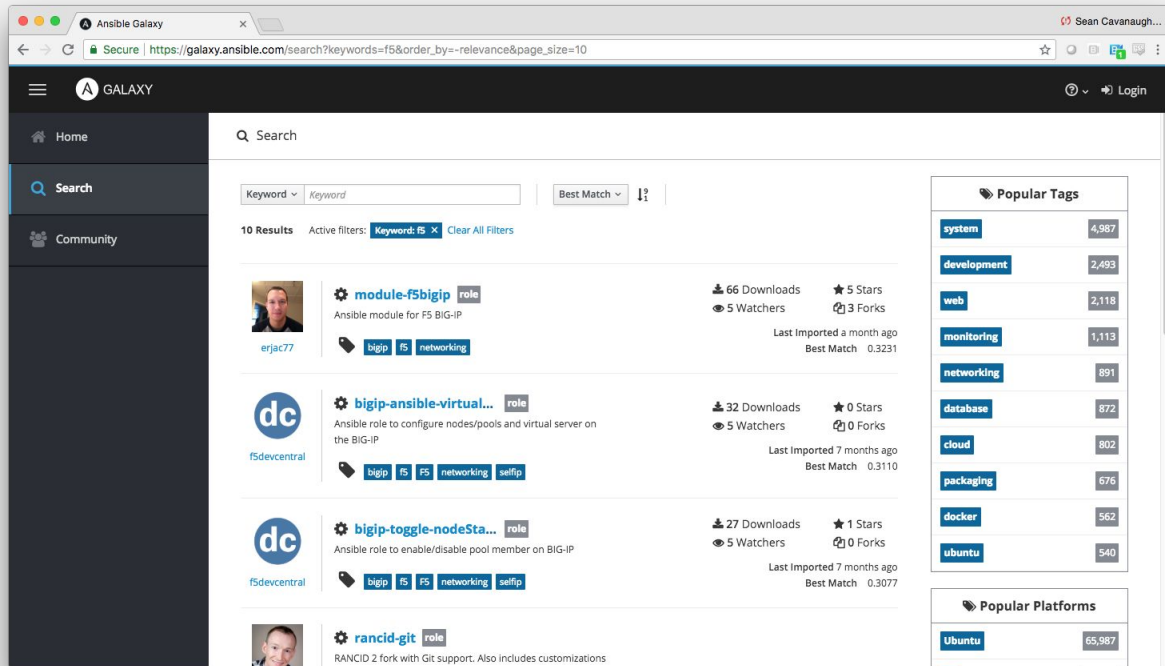

```
- name: CONFIGURE NTP
  ios_config:
    lines: ntp server 1.2.3.4
```

```
- name: CONFIGURE VLAN
  ios_vlan:
    vlan_id: 100
```

Ansible Galaxy

<http://galaxy.ansible.com>

- Ansible Galaxy is a hub for finding, reusing and sharing Ansible roles.
- Jump-start your automation project with content contributed and reviewed by the Ansible community.

Using parsers to generate custom reports

On most network devices, show command output is "pretty" formatted but not structured.

The Ansible **network-engine** role provides support for 2 text parsing engines:

- TextFSM
- Command Parser

```
---
- name: GENERATE INTERFACE REPORT
  hosts: cisco
  gather_facts: no
  connection: network_cli

  roles:
    - ansible-network.network-engine

  tasks:
    - name: CAPTURE SHOW INTERFACES
      ios_command:
        commands:
          - show interfaces
      register: output

    - name: PARSE THE RAW OUTPUT
      command_parser:
        file: "parsers/show_interfaces.yml"
        content: "{{ output.stdout[0] }}"
```

```
rtr2#show interfaces
GigabitEthernet1 is up, line protocol is up
  Hardware is CSR vNIC, address is 0e56.1bf5.5ee2 (bia 0e56.1bf5.5ee2)
  Internet address is 172.17.16.140/16
  MTU 1500 bytes, BW 1000000 Kbit/sec, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive set (10 sec)
  Full Duplex, 1000Mbps, link type is auto, media type is Virtual
  output flow-control is unsupported, input flow-control is unsupported
  ARP type: ARPA, ARP Timeout 04:00:00
.
.
.
.
.
<output omitted for brevity>
```

```
TASK [DISPLAY THE PARSED DATA] *****
ok: [rtr1] => {
  "interface_facts": [
    {
      "GigabitEthernet1": {
        "config": {
          "description": null,
          "mtu": 1500,
          "name": "GigabitEthernet1",
          "type": "CSR"
        }
      }
    },
    {
      "Loopback0": {
        "config": {
          .
          .
          .
          .
          .
        }
      }
    }
  ]
}
<output omitted for brevity>
```

ANSIBLE
Engine

20:00

Exercise 3.1

Building dynamic documentation using the command parser

The objective of this lab is to generate a dynamic documentation from the output of a device `show` command.

Approximate time: 20 mins

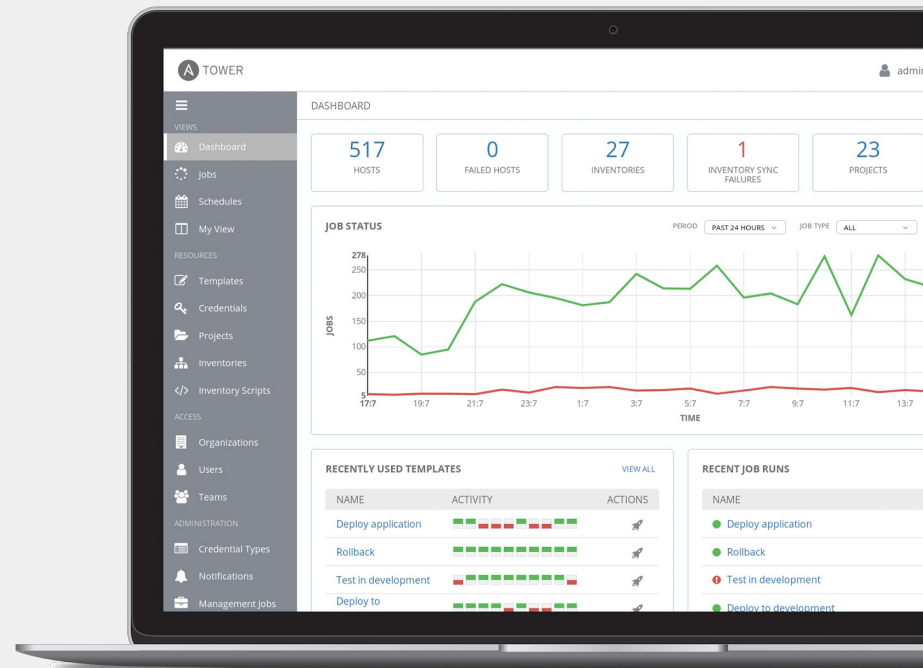

RED HAT®
ANSIBLE®
Tower

AUTOMATION ACROSS THE ENTERPRISE

WHAT IS ANSIBLE TOWER?

Ansible Tower is a UI and RESTful API allowing you to scale IT automation, manage complex deployments and speed productivity.

- Role-based access control
- Deploy entire applications with push-button deployment access
- All automations are centrally logged
- Powerful workflows match your IT processes

RBAC

Allow restricting playbook access to authorized users. One team can use playbooks in check mode (read-only) while others have full administrative abilities.

PUSH BUTTON

An intuitive user interface experience makes it easy for novice users to execute playbooks you allow them access to.

RESTful API

With an API first mentality every feature and function of Tower can be API driven. Allow seamless integration with other tools like ServiceNow and Infoblox.

WORKFLOWS

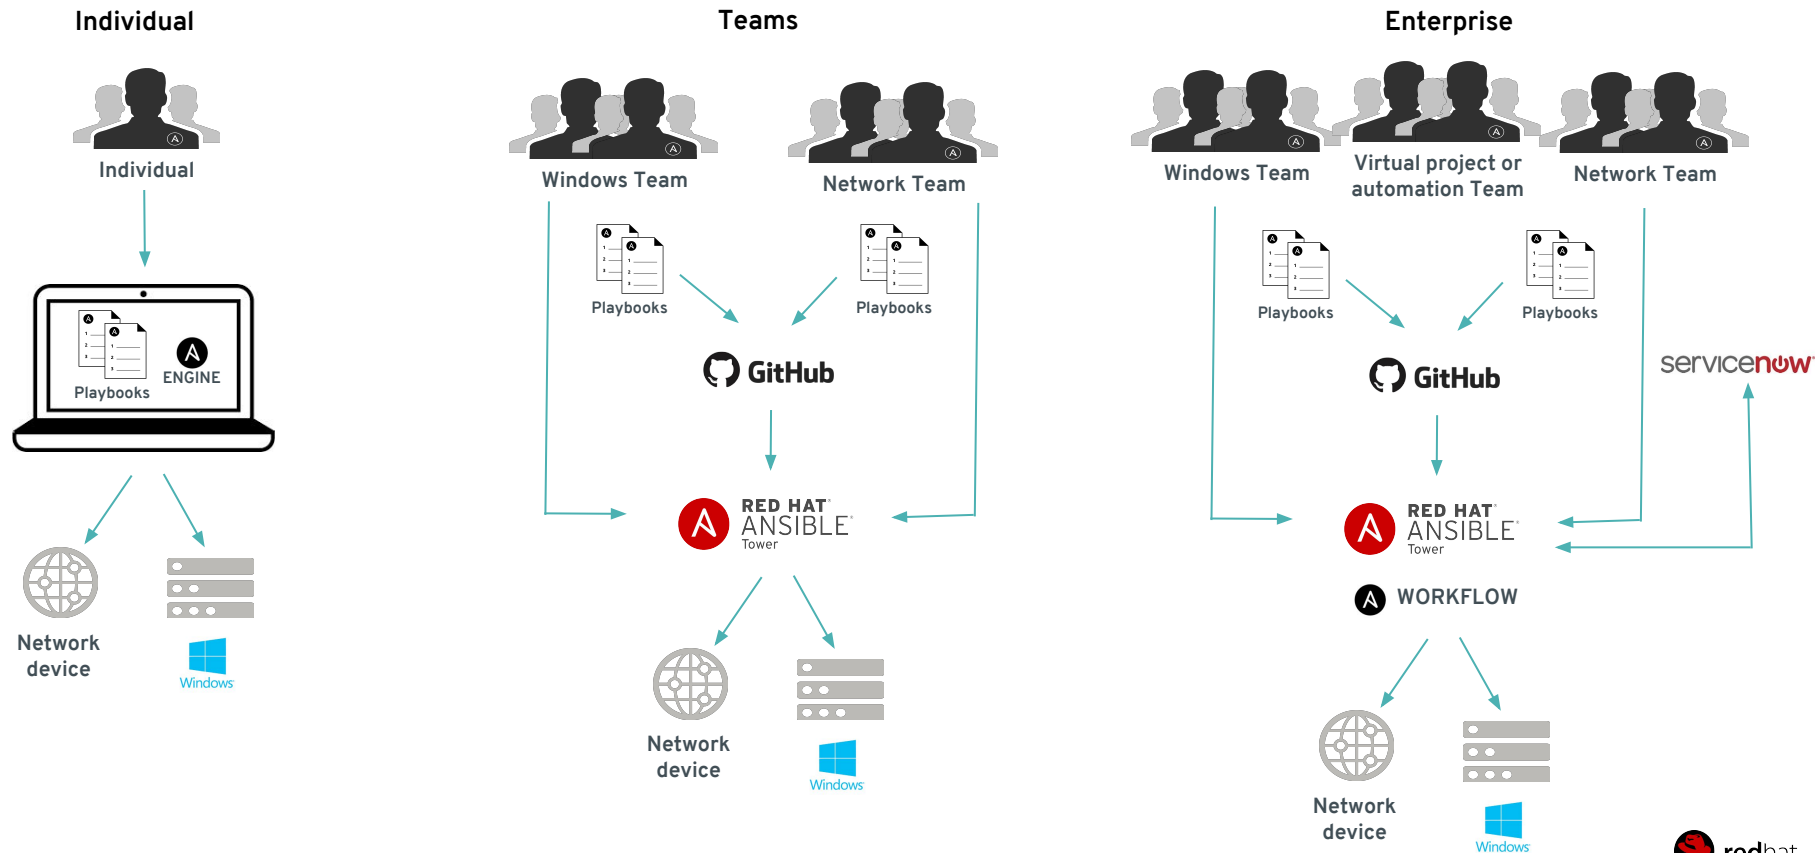

Ansible Tower's multi-playbook workflows chain any number of playbooks, regardless of whether they use different inventories, run as different users, run at once or utilize different credentials.

ENTERPRISE INTEGRATIONS

Integrate with enterprise authentication like TACACS+, RADIUS, Azure AD. Setup token authentication with OAuth 2. Setup notifications with PagerDuty, Slack and Twilio.

CENTRALIZED LOGGING

All automation activity is securely logged. Who ran it, how they customized it, what it did, where it happened - all securely stored and viewable later, or exported through Ansible Tower's API.
