Nuclear and Particle Physics

W. S. C. Williams

Department of Physics, University of Oxford
and St Edmund Hall, Oxford

CLARENDON PRESS · OXFORD
1991

Contents

1 Introduction

1.1 Historical perspective 1
1.2 The Rutherford scattering formula 5
1.3 The properties of the Rutherford differential cross-section 9
1.4 The experiments of Rutherford and his colleagues 10
1.5 Examination of the assumptions 10
1.6 The nuclear constituents 13
1.7 What is coming? 16
Reference 16

2 Some Quantitative Formalities

2.1 Introduction 17
2.2 The scale of nuclear physics and suitable units 17
2.3 The radioactive decay law 20
2.4 Multimodal decays 23
2.5 The production of radioactive material 25
2.6 Sequential decays 26
2.7 The measurement of the transition rate 27
2.8 Radioactive dating 29
2.9 Decay and the uncertainty principle 29
2.10 Collisions and cross-sections 31
2.11 Probabilities, expectations, and fluctuations 38
References 39

3 The Size and Shape of Nuclei

3.1 The size of nuclei 40
3.2 The scattering of electrons by nuclei 41
3.3 The nuclear electric charge distribution 41
3.4 The nuclear electric form-factor 42
3.5 The isotope shift 47
3.6 X-ray spectroscopy of mu-mesic atoms 48
3.7 Nuclear scattering and nuclear size 50
3.8 Overview of size determinations 52
3.9 The shape of nuclei 52
References 53

4 The Masses of Nuclei

4.1 The naturally occurring nuclei 54
4.2 The nuclear binding energy 55
4.3 The liquid drop model 56
4.4 The Coulomb and asymmetry terms 61
4.5 The implications of the semi-empirical mass formula 62
4.6 Conclusions 64
References 65

5 Nuclear Instability

5.1 Nuclear decay 66
5.2 Energy-level diagrams 66
5.3 More on β-decay 67
5.4 The stability of nuclei 73
5.5 Spontaneous fission 78
5.6 Tricks with transition rates 79
5.7 Conclusion 80
Reference

6 Alpha Decay

6.1 Introduction 82
6.2 Other properties of α-decay 82
6.3 The simple theory of Coulomb barrier penetration 85
6.4 The angular momentum barrier 89
6.5 Decay schemes involving α-particle emission 92
6.6 Barriers in other decays 93
6.7 Some conclusions 96
References 96

7 Nuclear Collisions and Reactions

7.1 Historical introduction 98
7.2 Matters of definition 100
7.3 Kinematics of nuclear collisions 102
7.4 Conservation laws in nuclear collisions and reactions? 107
7.5 What can we learn from studying nuclear reactions 108
7.6 Nuclear spectroscopy 108
7.7 The compound nucleus model 112
7.8 Compound state properties 114
7.9 Direct reactions 120
7.10 Compound state to direct 122
7.11 Elastic scattering 123
7.12 Induced fission and the fission reactor 123
7.13 Reactor control and delayed neutron emission 127
7.14 Energy from nuclear fusion 128

7.15 Conclusion 129
References 130

8 Nuclear Models

8.1 Introduction 131
8.2 The magic numbers 1 131
8.3 The shell model: preliminaries 134
8.4 The spin–orbit interaction 140
8.5 The magic numbers 2 141
8.6 The spins and parities of nuclear ground states 142
8.7 Electromagnetic moments: magnetic dipole 144
8.8 Electromagnetic moments: electric quadrupole 148
8.9 Excited states in the shell model 151
8.10 The collective model and other developments 152
8.11 Reconciliation 154
8.12 *Au revoir* to nuclei 157

9 Forces and Interactions

9.1 Some nomenclature 158
9.2 Electromagnetism 159
9.3 The Dirac equation 160
9.4 Feynman diagrams 161
9.5 More fun with Feynman diagrams 165
9.6 Tests of QED 166
9.7 Nuclear forces 168
9.8 The bound two-nucleon system 171
9.9 The unbound two-nucleon system 172
9.10 The Yukawa theory 175
9.11 Quarks, gluons, and QCD 179
9.12 The strong interaction 181
9.13 The weak interaction 181
9.14 Conclusion 185
References 187

10 Hadrons and the Quark–Parton Model

10.1 Introduction 188
10.2 The hadrons 188
10.3 The quark–parton Model: Stage I 194
10.4 The quark–parton Model: Stage II 199
10.5 The quark–parton Model: Stage III. Heavy flavours 207
10.6 Producing heavy flavours 210
10.7 The value of R and colour 213
10.8 Resonances in e^+e^- annihilation and quarkonia 215
10.9 Fragmentation 221
10.10 Further evidence for quarks and gluons 225

10.11 Isotopic spin 227
10.12 Conclusion 231
References 232

11 The Electromagnetic Interaction

11.1 Introduction 234
11.2 The energy loss by ionization 235
11.3 The bremsstrahlung process 247
11.4 Photon absorption and scattering 250
11.5 The radiation of photons by nuclei and particles 255
11.6 Rates for electric transitions 259
11.7 Rates for magnetic transitions 261
11.8 Selection rules in γ-ray emission 263
11.9 Nuclear isomerism 266
11.10 Other electromagnetic processes 267
11.11 Resonance fluorescence and absorption of photons 272
11.12 Summary 275
References 277

12 The Weak Interaction

12.1 A review 278
12.2 Neutrino and antineutrino 280
12.3 Neutrinos galore 283
12.4 The W and Z gauge bosons 286
12.5 The Fermi theory of β-decay 294
12.6 The Kurie plot 299
12.7 The ft value and some approximations 299
12.8 Fermi's coupling constant 304
12.9 Through the looking-glass 305
12.10 Neutrinos and the looking-glass 309
12.11 Neutrino scattering 311
12.12 Neutrino mass 318
12.13 Another neutrino problem 320
12.14 Conclusion 321
References 321

13 Particles: Summary and Outlook

13.1 The conservation laws 322
13.2 Recognizing what is going on 324
13.3 *CP* violation 327
13.4 The standard model 329
13.5 Beyond the standard model 333
13.6 Grand unified theories 333
13.7 Proton decay detectors 337
13.8 Theories of everything 341

13.9 Open questions 343
References 344

14 Nuclear and Particle Astrophysics

14.1 The expanding Universe 345
14.2 Big Bang nucleosynthesis 346
14.3 Stellar evolution 347
14.4 Stellar nucleosynthesis 1 350
14.5 Stellar nucleosynthesis 2 354
14.6 Nucleosynthesis: summary 355
14.7 Neutrinos in stellar evolution 1 357
14.8 Neutrinos in stellar evolution 2 360
14.9 Supernovae 362
14.10 SN1987A 364
14.11 Black hole formation 368
14.12 Now and the future 369
14.13 The first 225 seconds 370
14.14 Conclusion 373
