# 1-4 Pairs of Angles

## Warm Up

**Simplify each expression.**

1.  $90 - (x + 20)$      $70 - x$

2.  $180 - (3x - 10)$      $190 - 3x$

**Write an algebraic expression for each of the following.**

3. 4 more than twice a number     $2n + 4$

4. 6 less than half a number     $\frac{1}{2}n - 6$

# 1-4 Pairs of Angles

## *Objectives*

Identify adjacent, vertical, complementary, and supplementary angles.

Find measures of pairs of angles.

# 1-4 Pairs of Angles

## *Vocabulary*

adjacent angles

linear pair

complementary angles

supplementary angles

vertical angles

## 1-4 Pairs of Angles

Many pairs of angles have special relationships. Some relationships are because of the measurements of the angles in the pair. Other relationships are because of the positions of the angles in the pair.

# 1-4 Pairs of Angles

## Pairs of Angles

**Adjacent angles** are two angles in the same plane with a common vertex and a common side, but no common interior points.  $\angle 1$  and  $\angle 2$  are adjacent angles.

A **linear pair** of angles is a pair of adjacent angles whose noncommon sides are opposite rays.  $\angle 3$  and  $\angle 4$  form a linear pair.

# 1-4 Pairs of Angles

## Example 1A: Identifying Angle Pairs

Tell whether the angles are only adjacent, adjacent and form a linear pair, or not adjacent.

$\angle AEB$  and  $\angle BED$

$\angle AEB$  and  $\angle BED$  have a common vertex,  $E$ , a common side,  $\overrightarrow{EB}$ , and no common interior points. Their noncommon sides,  $\overrightarrow{EA}$  and  $\overrightarrow{ED}$ , are opposite rays. Therefore,  $\angle AEB$  and  $\angle BED$  are adjacent angles and form a linear pair.

# 1-4 Pairs of Angles

## Example 1B: Identifying Angle Pairs

Tell whether the angles are only adjacent, adjacent and form a linear pair, or not adjacent.

$\angle AEB$  and  $\angle BEC$

$\angle AEB$  and  $\angle BEC$  have a common vertex,  $E$ , a common side,  $\overrightarrow{EB}$ , and no common interior points. Therefore,  $\angle AEB$  and  $\angle BEC$  are only adjacent angles.

# 1-4 Pairs of Angles

## Example 1C: Identifying Angle Pairs

Tell whether the angles are only adjacent, adjacent and form a linear pair, or not adjacent.

$\angle DEC$  and  $\angle AEB$

$\angle DEC$  and  $\angle AEB$  share  $E$  but do not have a common side, so  $\angle DEC$  and  $\angle AEB$  are not adjacent angles.

# 1-4 Pairs of Angles

## Check It Out! Example 1a

Tell whether the angles are only adjacent, adjacent and form a linear pair, or not adjacent.

$\angle 5$  and  $\angle 6$

$\angle 5$  and  $\angle 6$  are adjacent angles. Their noncommon sides,  $\overrightarrow{PA}$  and  $\overrightarrow{PB}$ , are opposite rays, so  $\angle 5$  and  $\angle 6$  also form a linear pair.

# 1-4 Pairs of Angles

## Check It Out! Example 1b

Tell whether the angles are only adjacent, adjacent and form a linear pair, or not adjacent.

$\angle 7$  and  $\angle SPU$

$\angle 7$  and  $\angle SPU$  have a common vertex,  $P$ , but do not have a common side. So  $\angle 7$  and  $\angle SPU$  are not adjacent angles.

# 1-4 Pairs of Angles

## Check It Out! Example 1c

Tell whether the angles are only adjacent, adjacent and form a linear pair, or not adjacent.

$\angle 7$  and  $\angle 8$

$\angle 7$  and  $\angle 8$  have a common vertex,  $P$ , but do not have a common side. So  $\angle 7$  and  $\angle 8$  are not adjacent angles.

# 1-4 Pairs of Angles

## Complementary and Supplementary Angles

**Complementary angles** are two angles whose measures have a sum of  $90^\circ$ .  
 $\angle A$  and  $\angle B$  are complementary.

**Supplementary angles** are two angles whose measures have a sum of  $180^\circ$ .  
 $\angle A$  and  $\angle C$  are supplementary.

## 1-4 Pairs of Angles

You can find the complement of an angle that measures  $x^\circ$  by subtracting its measure from  $90^\circ$ , or  $(90 - x)^\circ$ .

You can find the supplement of an angle that measures  $x^\circ$  by subtracting its measure from  $180^\circ$ , or  $(180 - x)^\circ$ .

# 1-4 Pairs of Angles

## Example 2: Finding the Measures of Complements and Supplements

Find the measure of each of the following.

A. complement of  $\angle F$

$$(90 - x)^\circ$$

$$90^\circ - 59^\circ = 31^\circ$$

B. supplement of  $\angle G$

$$(180 - x)^\circ$$

$$\begin{aligned} 180 - (7x + 10)^\circ &= 180^\circ - 7x - 10 \\ &= (170 - 7x)^\circ \end{aligned}$$

# 1-4 Pairs of Angles

## Check It Out! Example 2

Find the measure of each of the following.

a. complement of  $\angle E$

$$(90 - x)^\circ$$

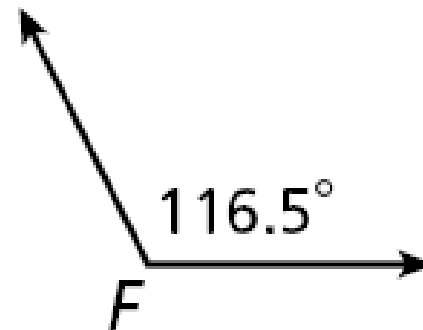

$$\begin{aligned} 90^\circ - (7x - 12)^\circ &= 90^\circ - 7x^\circ + 12^\circ \\ &= (102 - 7x)^\circ \end{aligned}$$

b. supplement of  $\angle F$

$$(180 - x)^\circ$$

$$180^\circ - 116.5^\circ = 63\frac{1}{2}^\circ$$

# 1-4 Pairs of Angles

## Example 3: Using Complements and Supplements to Solve Problems

**An angle is  $10^\circ$  more than 3 times the measure of its complement. Find the measure of the complement.**

**Step 1** Let  $m\angle A = x^\circ$ . Then  $\angle B$ , its complement measures  $(90 - x)^\circ$ .

**Step 2** Write and solve an equation.

$$x = 3(90 - x) + 10 \quad \textit{Substitute } x \textit{ for } m\angle A \textit{ and } 90 - x \textit{ for } m\angle B.$$

$$x = 270 - 3x + 10 \quad \textit{Distrib. Prop.}$$

$$x = 280 - 3x \quad \textit{Combine like terms.}$$

$$4x = 280 \quad \textit{Divide both sides by 4.}$$

$$x = 70 \quad \textit{Simplify.}$$

The measure of the complement,  $\angle B$ , is  $(90 - 70)^\circ = 20^\circ$ .

# 1-4 Pairs of Angles

## Check It Out! Example 3

An angle's measure is  $12^\circ$  more than  $\frac{1}{2}$  the measure of its supplement. Find the measure of the angle.

$$x = 0.5(180 - x) + 12$$

*Substitute  $x$  for  $m\angle A$  and  $180 - x$  for  $m\angle B$ .*

$$x = 90 - 0.5x + 12$$

*Distrib. Prop.*

$$x = 102 - 0.5x$$

*Combine like terms.*

$$1.5x = 102$$

*Divide both sides by 1.5.*

$$x = 68$$

*Simplify.*

The measure of the angle is  $68^\circ$ .

# 1-4 Pairs of Angles

## Example 4: Problem-Solving Application

Light passing through a fiber optic cable reflects off the walls of the cable in such a way that  $\angle 1 \cong \angle 2$ ,  $\angle 1$  and  $\angle 3$  are complementary, and  $\angle 2$  and  $\angle 4$  are complementary.

If  $m\angle 1 = 47^\circ$ , find  $m\angle 2$ ,  $m\angle 3$ , and  $m\angle 4$ .

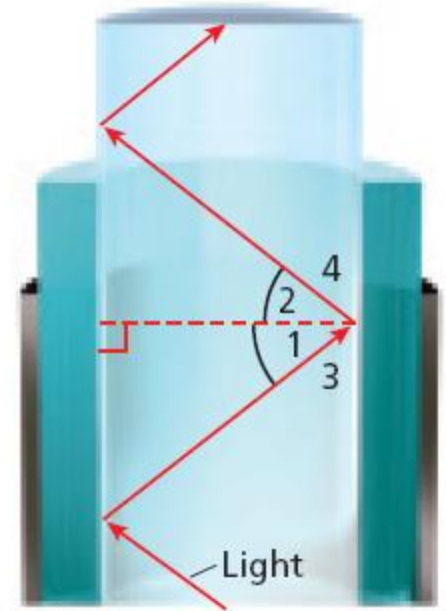

# 1-4 Pairs of Angles

## 1 Understand the Problem

The **answers** are the measures of  $\angle 2$ ,  $\angle 3$ , and  $\angle 4$ .

**List the important information:**

- $\angle 1 \cong \angle 2$
- $\angle 1$  and  $\angle 3$  are complementary, and  $\angle 2$  and  $\angle 4$  are complementary.
- $m\angle 1 = 47^\circ$

# 1-4 Pairs of Angles

## 2 Make a Plan

If  $\angle 1 \cong \angle 2$ , then  $m \angle 1 = m \angle 2$ .

If  $\angle 3$  and  $\angle 1$  are complementary, then  
 $m\angle 3 = (90 - 47)^\circ$ .

If  $\angle 4$  and  $\angle 2$  are complementary, then  
 $m\angle 4 = (90 - 47)^\circ$ .

# 1-4 Pairs of Angles

## 3 Solve

By the Transitive Property of Equality, if  $m\angle 1 = 47^\circ$  and  $m\angle 1 = m\angle 2$ , then  $m\angle 2 = 47^\circ$ .

Since  $\angle 3$  and  $\angle 1$  are complementary,  $m\angle 3 = 43^\circ$ . Similarly, since  $\angle 2$  and  $\angle 4$  are complementary,  $m\angle 4 = 43^\circ$ .

# 1-4 Pairs of Angles

## Look Back

The answer makes sense because  $47^\circ + 43^\circ = 90^\circ$ , so  $\angle 1$  and  $\angle 3$  are complementary, and  $\angle 2$  and  $\angle 4$  are complementary.

Thus  $m\angle 2 = 47^\circ$ ,  $m\angle 3 = 43^\circ$ , and  $m\angle 4 = 43^\circ$ .

# 1-4 Pairs of Angles

## Check It Out! Example 4

**What if...?** Suppose  $m\angle 3 = 27.6^\circ$ . Find  $m\angle 1$ ,  $m\angle 2$ , and  $m\angle 4$ .

# 1-4 Pairs of Angles

## 1 Understand the Problem

The **answers** are the measures of  $\angle 1$ ,  $\angle 2$ , and  $\angle 4$ .

**List the important information:**

- $\angle 1 \cong \angle 2$
- $\angle 1$  and  $\angle 3$  are complementary, and  $\angle 2$  and  $\angle 4$  are complementary.
- $m\angle 3 = 27.6^\circ$

# 1-4 Pairs of Angles

## 2 Make a Plan

If  $\angle 1 \cong \angle 2$ , then  $m\angle 1 = m\angle 2$ .

If  $\angle 3$  and  $\angle 1$  are complementary,  
then  $m\angle 1 = (90 - 27.6)^\circ$ .

If  $\angle 4$  and  $\angle 2$  are complementary,  
then  $m\angle 4 = (90 - 27.6)^\circ$ .

# 1-4 Pairs of Angles

## 3 Solve

By the Transitive Property of Equality, if  $m\angle 1 = 62.4^\circ$  and  $m\angle 1 = m\angle 2$ , then  $m\angle 2 = 62.4^\circ$ .

Since  $\angle 3$  and  $\angle 1$  are complementary,  $m\angle 3 = 27.6^\circ$ . Similarly, since  $\angle 2$  and  $\angle 4$  are complementary,  $m\angle 4 = 27.6^\circ$ .

# 1-4 Pairs of Angles

## 4 Look Back

The answer makes sense because  $27.6^\circ + 62.4^\circ = 90^\circ$ , so  $\angle 1$  and  $\angle 3$  are complementary, and  $\angle 2$  and  $\angle 4$  are complementary.

Thus  $m\angle 1 = m\angle 2 = 62.4^\circ$ ;  $m\angle 4 = 27.6^\circ$ .

# 1-4 Pairs of Angles

Another angle pair relationship exists between two angles whose sides form two pairs of opposite rays. **Vertical angles** are two nonadjacent angles formed by two intersecting lines.  $\angle 1$  and  $\angle 3$  are vertical angles, as are  $\angle 2$  and  $\angle 4$ .

# 1-4 Pairs of Angles

## Example 5: Identifying Vertical Angles

Name the pairs of vertical angles.

$\angle HML$  and  $\angle JMK$  are vertical angles.

$\angle HMJ$  and  $\angle LMK$  are vertical angles.

**Check**  $m\angle HML \approx m\angle JMK \approx 60^\circ$ .  
 $m\angle HMJ \approx m\angle LMK \approx 120^\circ$ .

# 1-4 Pairs of Angles

## Check It Out! Example 5

Name a pair of vertical angles. Do they appear to have the same measure?  
Check by measuring with a protractor.

$\angle EDG$  and  $\angle FDH$  are vertical angles and appear to have the same measure.

**Check**  $m\angle EDG \approx m\angle FDH \approx 45^\circ$

# 1-4 Pairs of Angles

## Lesson Quiz: Part I

$m\angle A = 64.1^\circ$ , and  $m\angle B = (4x - 30)^\circ$ . Find the measure of each of the following.

1. supplement of  $\angle A$   $115.9^\circ$
2. complement of  $\angle B$   $(120 - 4x)^\circ$
3. Determine whether this statement is true or false. If false, explain why. *If two angles are complementary and congruent, then the measure of each is  $90^\circ$ .*  
**False; each is  $45^\circ$ .**

# 1-4 Pairs of Angles

## Lesson Quiz: Part II

$$m\angle XYZ = 2x^\circ \text{ and } m\angle PQR = (8x - 20)^\circ.$$

4. If  $\angle XYZ$  and  $\angle PQR$  are supplementary, find the measure of each angle.

$$40^\circ; 140^\circ$$

5. If  $\angle XYZ$  and  $\angle PQR$  are complementary, find the measure of each angle.

$$22^\circ; 68^\circ$$
