

PERIODIC TRENDS

PERIODIC LAW

When elements are arranged in order of increasing atomic number, elements with **similar properties appear at regular intervals**

CHEMICAL REACTIVITY

Families

- Similar valence electrons within a group result in similar chemical properties
- **Valence electrons**: the electrons available to be lost, gained, or shared in the formation of chemical compounds

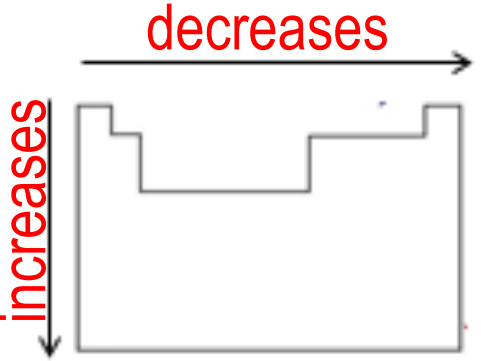

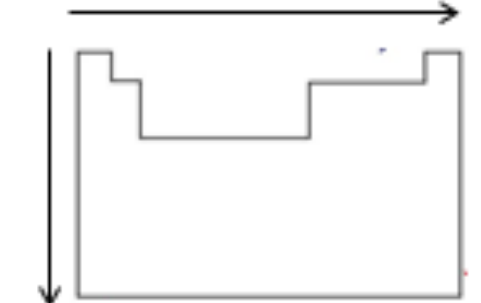

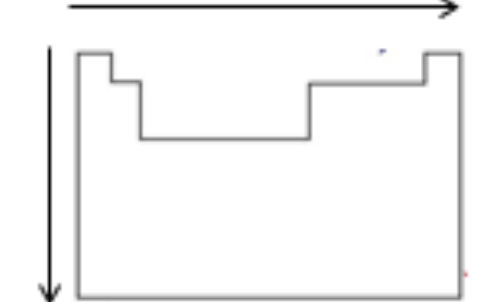

ATOMIC RADII

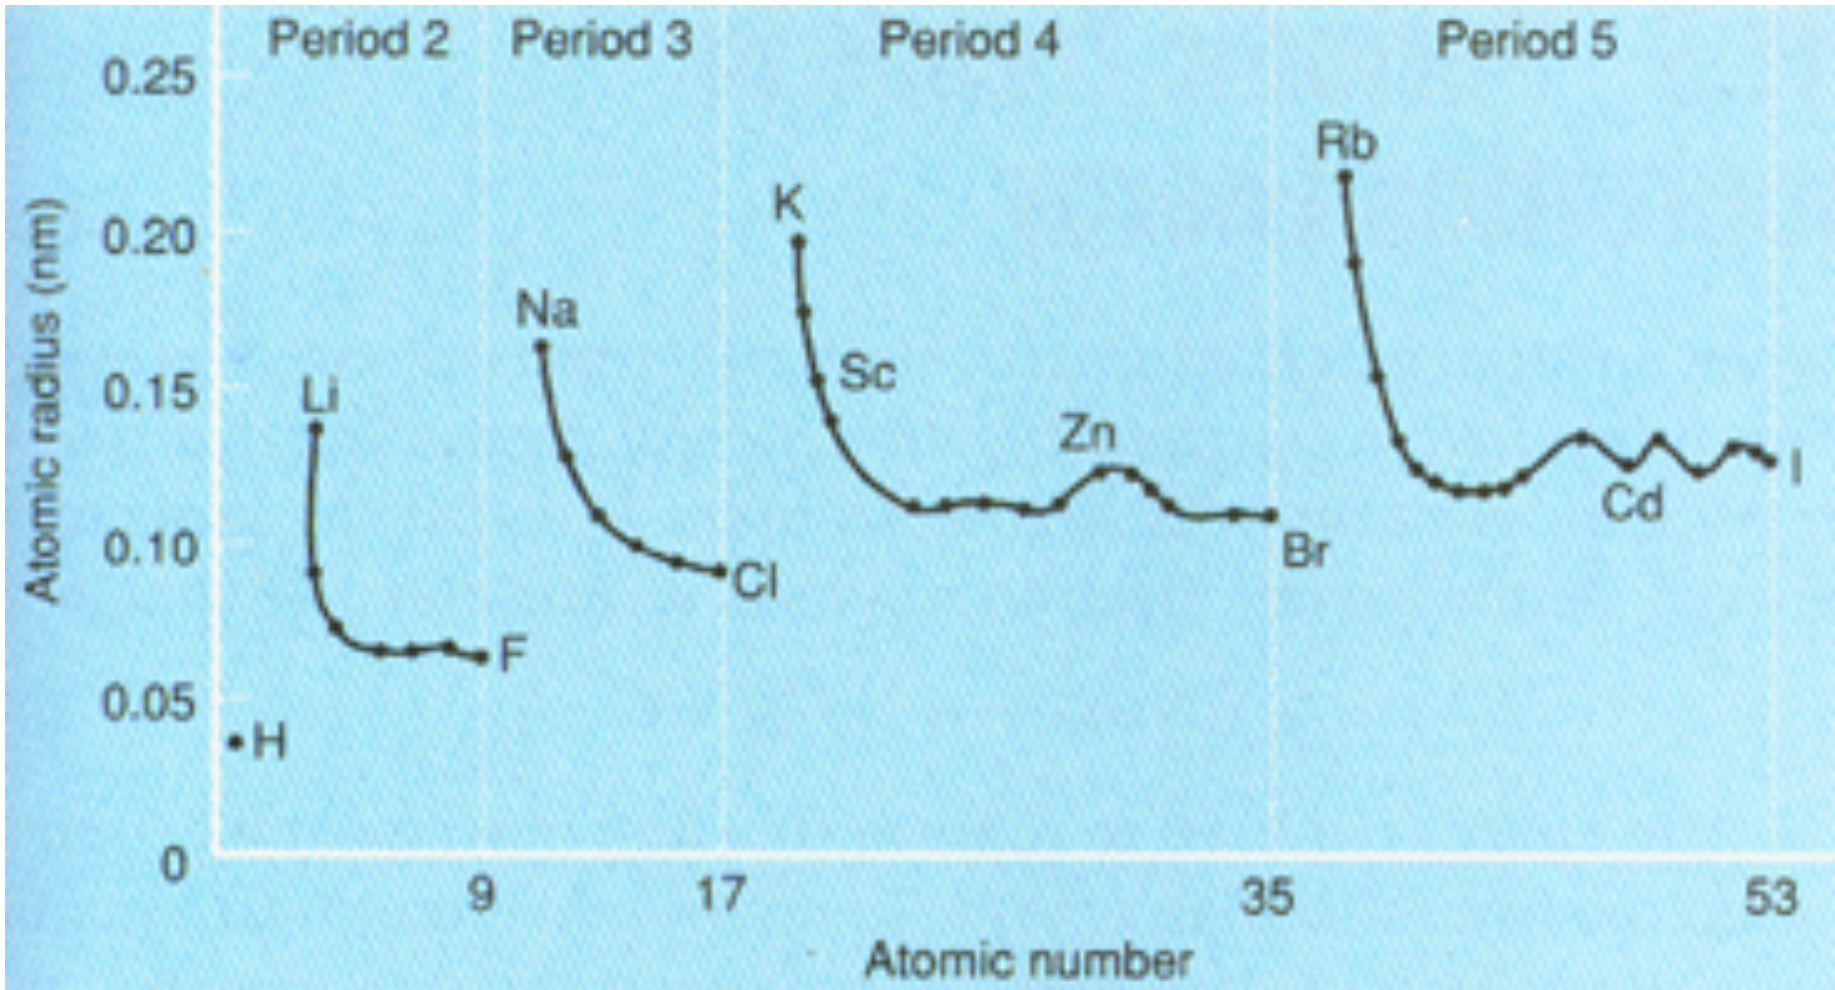

- Atomic radius**: one-half the distance between the nuclei of identical atoms that are bonded together

Term	Definition	Trend on the Periodic Table	Why?
Atomic Radius	<p><u>Atomic radius</u>: one-half the distance between the nuclei of identical atoms that are bonded together</p>		<p><u>Period</u>: Caused by increase in positive nuclear charge</p> <p><u>Group</u>: Higher energy levels have larger orbitals</p>
Ionization Energy			
Electronegativity			

Atomic Radius vs. Atomic Number

Plot of atomic radius versus atomic number shows period and group trends

SAMPLE PROBLEM

Of the elements magnesium, Mg, chlorine, Cl, sodium, Na, and phosphorus, P, which has the largest atomic radius? Explain your answer in terms of trends in the periodic table.

1. Find the elements listed in the periodic table.
2. Put the elements in order and determine the trend.
 - Sodium, Na.
 - Because atomic radii decreases across a period.

Of the elements calcium, Ca, beryllium, Be, barium, Ba, and strontium, Sr, which has the largest atomic radius? Explain your answer in terms of trends in the periodic table.

1. Find the elements listed in the periodic table.
2. Put the elements in order and determine the trend.
 - Barium, Ba.
 - Because atomic radii increases down a group.

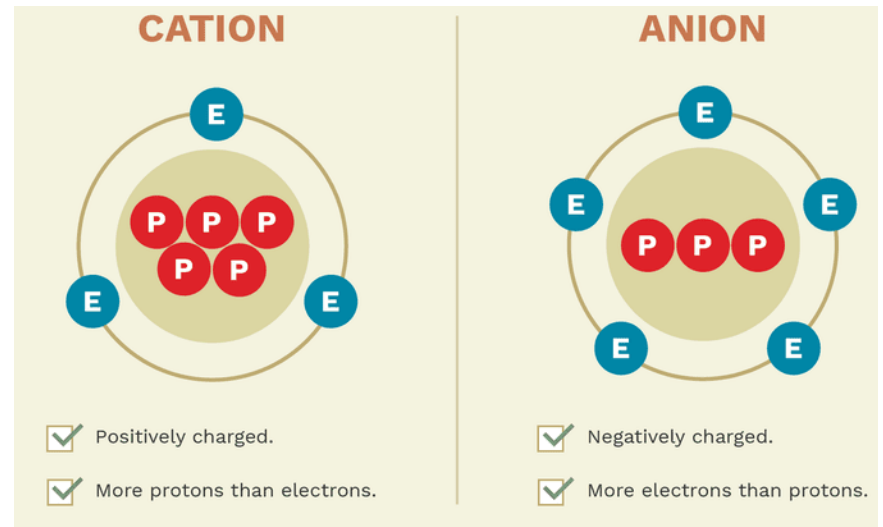

YOU TRY!

- **Of the elements Li, O, C, and F, identify the one with the largest atomic radius and the one with the smallest atomic radius.**
 - Largest: Li
 - Smallest: F

- **Of the elements Br, At, F, I, and Cl, identify the one with the smallest atomic radius and the one with the largest atomic radius.**
 - Smallest: F
 - Largest: At

IONIZATION ENERGY

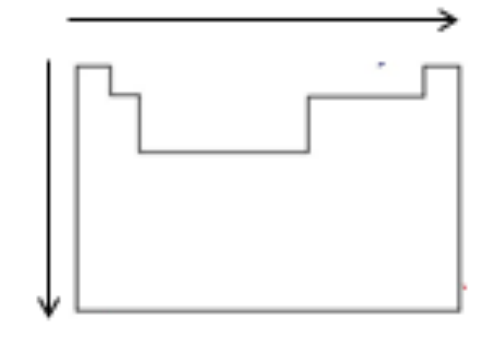

- **Ion**: an atom or group of bonded atoms that has a positive or negative charge
 - Positive ion = removal of electron
 - Negative ion = addition of electron

- **Ionization**: any process that results in the formation of an ion
- **Ionization energy (IE)**: the energy required to remove one electron from a neutral atom of an element
 - *Indicates how strongly an atom's nucleus holds onto its electrons*

First Electron Ionization Energy

Term	Definition	Trend on the Periodic Table	Why?
Atomic Radius	<p><u>Atomic radius</u>: one-half the distance between the nuclei of identical atoms that are bonded together</p>		<p><u>Period</u>: Caused by increase in positive nuclear charge</p> <p><u>Group</u>: Higher energy levels have larger orbitals</p>
Ionization Energy	<p><u>Ionization energy</u>: the energy required to remove one electron from a neutral atom of an element</p>		<p><u>Period</u>: Higher charge more strongly attracts electrons in the same energy level</p> <p><u>Group</u>: Less energy required to remove electrons farther from the nucleus</p>
Electronegativity			

ELECTRON AFFINITY

- **Electron affinity**: the energy change that occurs when an electron is acquired by a neutral atom
- Most atoms release energy when they acquire an electron
- Some atoms must be “forced” to gain an electron by the addition of energy
 - Ion produced this way will be unstable and will lose the added electron easily

IONIC RADII

Cation (+)

- **Cation**: positive ion
- Formation by the loss of one or more electrons
- Smaller than the atoms from which they are formed
- Remaining electrons are drawn closer to the nucleus by its unbalanced positive charge

Anions (-)

- **Anion**: negative ion
 - Formation by the addition of one or more electrons
 - Leads to an increase in atomic radius
 - Electron cloud spreads out due to greater repulsion between the increased number of electrons
-
- *Metals to the left tend to form cations*
 - *Nonmetals at the upper right tend to form anions*

Group 1A

Ion	Atom	Ion	Atom	Ion	Atom	Ion	Atom	Ion	Atom
Li ⁺ 76	Li 152	Be ²⁺ 45	Be 112	B ³⁺ 23	B 85	O ²⁻ 140	O 73	F ⁻ 133	F 72
Na ⁺ 102	Na 186	Mg ²⁺ 66	Mg 160	Al ³⁺ 51	Al 143	S ²⁻ 184	S 103	Cl ⁻ 181	Cl 100
K ⁺ 151	K 227	Ca ²⁺ 100	Ca 197	Ga ³⁺ 62	Ga 135	Se ²⁻ 198	Se 119	Br ⁻ 196	Br 114
Rb ⁺ 161	Rb 248	Sr ²⁺ 126	Sr 215	In ³⁺ 80	In 167	Te ²⁻ 207	Te 142	I ⁻ 220	I 133

Ex: Which particle has the larger radius?

- S or S²⁻

- S²⁻

- Al or Al³⁺

- Al

ELECTRONEGATIVITY

Electronegativity: measure of the ability of an atom in a chemical compound to attract electrons

The periodic table displays electronegativity values for elements. Carbon (C) is highlighted with its atomic number (6) and electronegativity (2.5). The values generally increase from left to right and bottom to top across the periodic table.

Group	1	2	13	14	15	16	17	18
1	H (2.1)							He (—)
2	Li (1.0)	Be (1.5)	B (2.0)	C (2.5)	N (3.0)	O (3.5)	F (4.0)	Ne (—)
3	Na (0.9)	Mg (1.2)	Al (1.5)	Si (1.8)	P (2.1)	S (2.5)	Cl (3.0)	Ar (—)
4	K (0.8)	Ca (1.0)		Ge (1.8)	As (2.0)	Se (2.4)	Br (2.8)	Kr (3.0)
5	Rb (0.8)	Sr (1.0)		In (1.7)	Sb (1.9)	Te (2.1)	I (2.5)	Xe (2.6)
6	Cs (0.7)	Ba (0.9)		Tl (1.8)	Pb (1.8)	Bi (1.9)	Po (2.0)	Rn (2.4)
7	Fr (0.7)	Ra (0.9)						

Lanthanide series													
58	59	60	61	62	63	64	65	66	67	68	69	70	71

90	91	92	93	94	95	96	97	98	99	100	101	102	103
Th (1.3)	Pa (1.5)	U (1.4)	Np (1.4)	Pu (1.3)	Am (1.3)	Cm (1.3)	Bk (1.3)	Cf (1.3)	Es (1.3)	Fm (1.3)	Md (1.3)	No (1.3)	Lr (—)

Actinide series

Term	Definition	Trend on the Periodic Table	Why?
Atomic Radius	<p><u>Atomic radius</u>: one-half the distance between the nuclei of identical atoms that are bonded together</p>		<p><u>Period</u>: Caused by increase in positive nuclear charge</p> <p><u>Group</u>: Higher energy levels have larger orbitals</p>
Ionization Energy	<p><u>Ionization energy</u>: the energy required to remove one electron from a neutral atom of an element</p>		<p><u>Period</u>: Higher charge more strongly attracts electrons in the same energy level</p> <p><u>Group</u>: Less energy required to remove electrons farther from the nucleus</p>
Electronegativity	<p><u>Electronegativity</u>: measure of an ability of an atom in a chemical compound to attract electrons</p>		<p><u>Period</u>: Shared electrons are closer to the nucleus in small atoms</p> <p><u>Group</u>: Shared electrons are farther from the nucleus in large atoms</p>

PERIODIC PROPERTIES OF THE d AND f -BLOCK

- Properties of the d -block element vary less and with less regularity than those of the main-group elements
 - Difference is due to the presence of electrons in incompletely filled d sublevels in the atoms of the d -block elements
