

Practical Data for Metallurgists

Practical Data for Metallurgists **18th Edition**

The Industry Standard for More Than 60 Years

The renowned *Practical Data for Metallurgists* has served as an essential industry reference since its introduction in 1953. This guide includes an updated listing of standard steels and their chemical compositions, hardening abilities and tolerances. Technical experts, operations managers and engineers depend on this handbook as the definitive source for metallurgical information – and more.

At TimkenSteel, a problem-solving mindset and relentless customer focus permeate our culture. About 40 percent of our salaried workforce consists of degreed engineers. Our sales engineers on the front line work in partnership with our customers to understand not only their application, but also the system around it. Our team of career metallurgists has some of the deepest material science experience in the world. We put this expertise, which also conforms to American Iron and Steel Institute and Society of Automotive Engineers standards, into this 18th edition of *Practical Data for Metallurgists*.

TABLE OF CONTENTS

	Page Number
Steel Chemistries	
Chemical Compositions, etc.	4 – 32
Miscellaneous Steel Properties	
USA-European-Japanese Grades	33
European Industrial Standards	34 – 37
Japanese Automotive Standards	38 – 42
Japanese Industrial Standards	43 – 48
Hardenability Band Data	49 – 59
Restricted Hardenability Band Data	60 – 62
Jominy Correlation with Round Bars	63 – 66
Combined Hardenability Charts	67 – 80
Martensite Percent vs. Carbon Content and Hardness	81
Relationship of Fatigue Strength to Tensile Strength	82
Carburizing Rates of Carbon and Alloy Steels	83 – 87
Critical Transformation Temperatures and Ms/Mf Points	88 – 90
Hot Working Temperatures	91 – 92
Tubing	
General Tolerances	93 – 94
Length Tolerances	95
Straightness Tolerances	96 – 97
Tube Size Calculations	98 – 101
OD Cleanups	102
Formulas for Calculating Surface Cleanup	103
Formulas for Calculating Camber (Straightness) Cleanup	103
Bar	
General Tolerances	104 – 105
Straightness Tolerances	105
Weight Table – Rounds and Squares	106 – 109
Reduction Ratios for Round and Square Bars	110
Cold Shearing Metric Equivalents and Limitations	111 – 117
Estimated Mechanical Properties for Bars	118 – 119
Miscellaneous Information	
Iron Carbon Phase Diagram	120 – 121
Statistical Process Control (SPC) Information	124 – 125
Handy Physical Constants	126
Engineering Conversion Factors	127 – 129
Metric-English Stress Conversion Tables	130
Work-Energy Conversion Tables	131
Decimal Equivalent Chart	132 – 133
Temperature Conversion Tables	134 – 135
Hardness Conversion Tables	136 – 137
Useful Equations for Hardenable Alloy Steels	138
Glossary of Metallurgical Terms	139 – 144
Glossary of Forging Terms	145 – 149

STANDARD CARBON STEELS

Chemical Composition Ranges and Limits

SAE No.	C	Mn	P Max	S Max
1005	.06 max	.35 max	.040	.050
1006	.08 max	.25/.40	.040	.050

⁽²⁾ Max Cu .10, Co .25, W .25, P .015, S .010

⁽³⁾ Deep hardening steels.

⁽⁴⁾ Through hardening steel for service up to 600 F.

⁽⁵⁾ Carburizing steel for service up to 600 F.

⁽⁶⁾ Carburizing steel for service up to 1000 F.

⁽⁷⁾ Through hardening steel can be air quenched.

INTRODUCTION TO JOMINY CORRELATION WITH ROUND BARS

The following correlation of Jominy values with quenching severity and surface to center hardnesses obtainable in round bars is based on calculated and practical experience data.

Since practical heat treatment results are subject to several variables that are always difficult to determine i.e., surface condition of piece being quenched, furnace atmosphere, and quenching severity of the coolant, the metallurgist or heat treater may find some differences in applying this correlation to his particular heat treatment setup.

However, as experience is gained by their use, it is believed that these charts will be found helpful as a guide to the selection of steel of proper hardenability based on Jominy end quench results. As a value-added service, TimkenSteel hardenability data will be supplied upon request, with each heat of steel.

CHART FOR PREDICTING APPROXIMATE CROSS SECTION HARDNESS OF QUENCHED ROUND BARS USING JOMINY TEST RESULTS

INSTRUCTIONS FOR USE OF CHART

1. Select proper round bar size to be quenched.
2. Select the curve most representative of quenching conditions (H value) to be used.
3. Read the curve to the Jominy Distance.
4. Insert Rockwell "C" hardness values corresponding to the Jominy Distance. These are obtained from TimkenSteel

EXPLANATION OF COMBINED HARDENABILITY CHARTS

The following charts present hardenability data for thirteen popular steels. They may be used to determine the approximate mid-radius hardness which is developed, in various sized rounds up to 9" in diameter using a good oil quench (.4-.5 Hv), or rounds up to 15" in diameter when air cooling. The effect of a subsequent 1000°F 2 hour temper is also illustrated.

The relationship between hardness and section size was determined using data from the Jominy end quench test, and air hardenability test, and controlled cooling tests. It must be remembered that the results for a particular steel type are based on one chemical analysis and one austenitizing temperature. Variations of these will affect hardenability, as shown by the Jominy hardenability bands (shaded area). Therefore, the charts should be used to determine estimated, rather than exact, hardness values.

USE OF CHARTS

1. Select steel type.
2. Find desired diameter for the quenching medium employed.
3. Read the approximate as-quenched or tempered hardness using the appropriate curve; read hardness range using hardenability band.

For example, a 2-inch round made of 1045 type steel will develop the following mid-radius hardnesses:

	Mild Water	Oil .4-.5 Hv	Air
As-Cooled	28(25/32) Rc	25(22/29) Rc	91Rb
Tempered 1000 °F-2 Hours	22.5 Rc	21 Rc	91Rb

AVERAGE RELATIONSHIPS BETWEEN CARBON CONTENT, HARDNESS AND PERCENTAGE OF MARTENSITE IN QUENCHING

Hodge, J. M. and Orehoski, M. A.
 Relationship between hardenability and percentage of martensite in some low-alloy steels.
 Transactions. AIME, 1946, v. 167, pp. 627-642.

Note: Fine divisions added to simplify use of the graph.

Note: Endurance limits for surfaces exposed to corrosive environment fall below the band for hot rolled, severely notched, and as forged surfaces.

CONDITIONS WHICH AFFECT FATIGUE STRENGTH

The fatigue strength of a material depends on many factors of which the following are considered among the most important: (1) the strength of the material and the magnitude of the stress being applied to the material in its application, (2) the surface integrity of the material including its finish and method of manufacture, magnitude of residual stress present, and the presence of decarburization, (3) the environment in which the material is exposed in service.

It must be noted that fatigue data such as that represented by the curves shown above are averages obtained from laboratory tests which approach ideal conditions and should not be considered more than a guide.

F.B. Stulen and W.C. Schulte, Metals Engineering Quarterly (Am. Soc. Metals), Vol. 5, No. 3, Aug. 1965

SAE Fatigue Design Handbook (AE4) - 1968

PROCESS AND QUALITY CONTROL CONSIDERATIONS

Variation of carbon potential with dew point for an endothermic-based atmosphere containing 20% CO and 40% H₂ in contact with plain carbon steel at various workpiece temperatures.

PROCESS AND QUALITY CONTROL CONSIDERATIONS

Variation of carbon potential with carbon dioxide concentration for an endothermic-based atmosphere containing 20% CO and 40% H₂ in contact with plain carbon steel at various workpiece temperatures.

DETERMINING CARBURIZING TIMES AND TEMPERATURES

TO USE THE CHART

In the upper grid, select a point (time and temperature) for which the case depth results are known. Go vertically down from that point to the known case depth and plot the point. Pass a line through this point parallel to the dashed line shown. Projecting a line vertically upward from any point on this line into the grid will give the combinations of time and temperature that will result in the same depth of case. For instance, a vertical line drawn upward from the dashed line at 100 thousandths indicates that a 0.100 in. case will be produced by 6 hr. at 1900°F, 11 hr. at 1800°F, or 22 hr. at 1700°F. Shop experience of the Cook Heat Treat Co., Houston, is depicted by this line and its related points.

Adapted from information provided by Charles F. Lewis, Cook Heat Treating Co., Div. Lindberg Corp.

MECHANICAL TUBING TOLERANCES

Standard TimkenSteel Tolerances

HOT ROLLED, ROUND⁽¹⁾

OD Tolerances

As rolled or single thermal treatment:

- inches
 $T_{OD} = \pm (.0045 \text{ OD} + .005) \text{ or } \pm .015 \text{ min.}$
- mm
 $T_{OD} = \pm (.0045 \text{ OD} + .13) \text{ or } \pm .38 \text{ min.}$
- over 10.75 inches (273mm) to 12.0 inches (305mm)
 - inches $T_{OD} = \pm .095$
 - mm $T_{OD} = \pm 2.41$
- over 12.00 inches (305mm) to 13 inches (330mm)
 - inches $T_{OD} = \pm .010 \times \text{OD}$
 - mm $T_{OD} = \pm .010 \times \text{OD}$

Quenched and tempered, or normalized and tempered:

- inches
 $T_{OD} = \pm 1.5 (.0045 \text{ OD} + .005) \text{ or } \pm .023 \text{ min.}$
- mm
 $T_{OD} = \pm 1.5 (.0045 \text{ OD} + .13) \text{ or } \pm .58 \text{ min.}$
- over 10.75 inches (273mm) to 12.00 inches (305 mm)
 - inches $T_{OD} = \pm .113$
 - mm $T_{OD} = \pm 2.87$
- over 12.00 inches (305mm) to 13 inches (330mm)
 - inches $T_{OD} = \pm .010 \times \text{OD}$
 - mm $T_{OD} = \pm .010 \times \text{OD}$

Wall Tolerances (All Thermal Conditions)

OD to wall ratio over 10:1 or over 10.75 inches (273 mm) to 13.00 inches (330 mm) OD

(all OD to wall ratios) $\pm 10\%$

OD to wall ratio of 10:1 or less $\pm 7.5\%$

Note: Minimum wall tolerance is $\pm .020$ inch (.51mm).

OD - Outside Diameter T - Tolerance ID - Inside Diameter W - Wall Thickness

⁽¹⁾ Hot rolled and rough turned tubes can be purchased to outside diameter (OD) and wall thickness (W) only.

TimkenSteel guaranteed tube sizes are calculated using TimkenSteel tolerances.

MECHANICAL TUBING TOLERANCE - continued
Standard TimkenSteel Tolerances

ROUGH TURNED, ROUND⁽¹⁾

OD Tolerances

As turned or single thermal treatment:

- under 6.75 inches (171.5mm)
 inches $T_{OD} = \pm .005$
 mm $T_{OD} = \pm .13$
- 6.75 inches (171.5mm) and over
 inches $T_{OD} = \pm .010$
 mm $T_{OD} = \pm .25$

Straightened and/or tempered or stress relieved after rough turning:

inches $T_{OD} = \pm .010$
 mm $T_{OD} = \pm .25$

Quenched and tempered, or normalized and tempered:

- Under 6.75 inches (171.5mm)
 Heat Treated Before Rough Turned
 $T_{OD} = \pm .010$ inches ($\pm .25$ mm)
 Heat Treated After Rough Turned
 $T_{OD} = \pm .015$ inches ($\pm .38$ mm)
- 6.75 inches (171.5mm) and over
 Heat Treated Before Rough Turned
 $T_{OD} = \pm .020$ inches ($\pm .51$ mm)
 Heat Treated After Rough Turned
 $T_{OD} = \pm .030$ inches ($\pm .76$ mm)

Wall Tolerances (All Thermal Conditions)

OD to wall ratio over 10:1 $\pm 12.5\%$
 OD to wall ratio of 10:1 or less $\pm 10.0\%$

Note: Minimum wall tolerance is $\pm .020$ inch (.51mm).

OD - Outside Diameter T - Tolerance ID - Inside Diameter W - Wall Thickness

⁽¹⁾ Hot rolled and rough turned tubes can be purchased to outside diameter (OD) and wall thickness (W) only.

TimkenSteel guaranteed tube sizes are calculated using TimkenSteel tolerances.

LENGTH TOLERANCES

All Conditions - Seamless Steel Tubing

Random Lengths

Tubing shipped on random-length orders has a length spread of 7 feet (2.1 meters) with a mean length 10 feet to 26 feet (3 to 8 meters) unless otherwise specified

Multiple Lengths

For tubing ordered in multiple lengths, it is standard practice for the customer to make their own allowances for loss of steel due to cutting operations. These allowances will vary from one customer to another due to their cutting practices and the amount of facing required on the ends of the part. Therefore, tubing is furnished to the multiple length as specified by the individual customer.

In Inches

Specified Length	Specified Size Outside Diameter	Permissible Variations	
		Over	Under
4 feet and under	Up to 2 inches incl.	1/16 inch	0
4 feet and under	Over 2 inches to 4 inches incl.	3/32 inch	0
4 feet and under	Over 4 inches	1/8 inch	0
Over 4 feet to 10 feet, incl.	Up to 2 inches incl.	3/32 inch	0
Over 4 feet to 10 feet, incl.	Over 2 inches	1/8 inch	0
Over 10 feet to 24 feet, incl.	All	3/16 inch	0
Over 24 feet to 34 feet, incl.	All	5/16 inch	0
Over 34 feet to 44 feet, incl.	All	7/16 inch	0

In Meters

Specified Length	Specified Size Outside Diameter	Permissible Variations	
		Over	Under
1 meter and under	Up to 50mm incl.	1mm	0
1 meter and under	Over 50mm to 100mm incl.	2mm	0
1 meter and under	Over 100mm	3mm	0
Over 1 meter to 3 meters	Up to 50mm incl.	2mm	0
Over 1 meter to 3 meters	Over 50mm	3mm	0
Over 3 meters to 7 meters	All	5mm	0
Over 7 meters to 10 meters	All	8mm	0
Over 10 meters to 13 meters	All	11mm	0

STRAIGHTNESS TOLERANCES

All Conditions - Seamless Steel Tubing

Straightness tolerances (T) should not exceed those shown in the tables below. The tolerance (T) for any 3-foot (1 meter) length is measured as shown in Figure 1. The total tolerance, the maximum curvature in the total length, is measured as shown in Figure 2. The table applies to lengths not exceeding 22 feet (6.7 meters).

The tolerances shown apply to conventional steel grades of as rolled, annealed, and heat treated tubing up to 302 Brinell maximum or micro alloy grades with a hardness of 229 Brinell or below. Heat treated tubes with a Brinell hardness of 302 maximum up to 401 maximum or micro alloy grades with a Brinell hardness exceeding 229 will have tolerance (T) twice the values shown in the table. Tubes with lighter walls, or with hardness exceeding 401 Brinell maximum, or weighing greater than 140 pounds per foot, require agreement on tolerances at time of order.

FIGURE 1

Measuring technique for straightness in any three feet

FIGURE 2

Measuring technique for overall straightness

STRAIGHTNESS TOLERANCES – continued
Seamless Steel Tubing⁽¹⁾

In Inches		Maximum Curvature in any 3 feet	Maximum Curvature in Total Lengths of 5 feet or more	Maximum Curvature for Lengths Under 5 feet
Specified Siz	OD 5 inches and smaller. Wall thickness, over 3% of OD	.030 inch	$.020 \text{ inch} \times \frac{\text{length in feet}}{3}$	Ratio of .010 inch per foot
	OD over 5 inches to 8 inches inclusive. Wall thickness, over 4% of OD	.045 inch	$.030 \text{ inch} \times \frac{\text{length in feet}}{3}$	Ratio of 0.015 inch per foot
	OD over 8 inches to 12 3/4 inches inclusive. Wall thickness, over 4% of OD	.060 inch	$.045 \text{ inch} \times \frac{\text{length in feet}}{3}$	Ratio of 0.020 inch per foot

In Meters

Specified Siz		Maximum Curvature in 1 meter	Maximum Curvature in Total Lengths of 1.5 meters or more	Maximum Curvature for Lengths Under 1.5 meters
OD 125mm and smaller. Wall thickness, over 3% of OD		.85mm	$.55 \text{ mm} \times \frac{\text{length in meters}}{1.5}$	Ratio of .85mm per meter
	OD over 125mm to 200mm inclusive. Wall thickness, over 4% of OD	1.25mm	$.85 \text{ mm} \times \frac{\text{length in meters}}{1.5}$	Ratio of 1.25mm per meter
OD over 200mm to 320mm inclusive. Wall thickness, over 4% of OD		1.65mm	$1.25 \text{ mm} \times \frac{\text{length in meters}}{1.5}$	Ratio of 1.65mm per meter

⁽¹⁾ Refer to the previous page for exception to the straightness tolerance.

TUBE SIZE CALCULATIONS

How Mechanical Tube Sizes Are Calculated

TimkenSteel has pioneered a method to determine the most economical tube size, which insures that all part dimensions will clean up during machining. This program has the capability to determine what we call a "guaranteed" tube size for either full or bright metal cleanup on the outer diameter and/or the inner diameter, based on the condition of the tube.

The guaranteed tube size is based on the part's critical finished dimensions and critical machining position. The required critical dimensions are: 1) maximum finished OD, 2) minimum finished ID, and 3) maximum finished part length. All applicable tolerances and surface finishes ("machined" or "ground") should be included. The critical machining position is based on whether the tube is chucked on the tube OD or the tube ID during the initial machining operation.

Critical finished part dimensions and machining position influence the amount of cleanup, the size tolerances and the tube eccentricity variables. These variables are then factored into the tube size calculation.

Cleanup Allowance

"Cleanup allowance" must be added to the finished OD dimension or subtracted from the finished ID dimension to provide for the elimination of surface imperfections, decarburization and camber (out-of-straightness). Other allowances specific to the application may be needed. (See table, page 98.)

Examples of Tube Size Calculation

Finished Part Dimensions

4.995 inches \pm .005 inch OD \times 4.005 inches \pm .005 inch ID \times 7 inches.

Part is cut to length and held on one end. Allowance for camber is made for parts over 3 inches, measured from the end of the part to the face of the chuck.

Examples on page 96 are for a hot rolled tube using TimkenSteel cleanup allowances.

TUBE SIZE CALCULATIONS - continued

Figure 1
Cross section of finished part requiring full cleanup of OD and ID surfaces.

Figure 2
Finished part with addition of cleanup stock to OD. (Refer to Example 1, Operation 1, page 96.)

Figure 3
Finished part showing cleanup stock added to ID. (Refer to Example 1, Operation 2.)

Figure 4
Finished part with cleanup allowance added to OD and ID determines minimum wall required for part to clean up. (Refer to Example 1, Operation 3.) Were it not for eccentricity, this would be the recommended tube size.

Figure 5
Same tube size machined true to OD showing effect of tube eccentricity. Tube ID is eccentric in relation to tube OD. Note that cleanup stock (dashed line) has been eliminated at A due to tube eccentricity. Part would not clean up at this point.

Figure 6
Here enough stock has been added to ID to protect cleanup stock required at minimum wall point A. (Refer to Example 1, Operations 4 and 5.)

When machining true to the ID, similar considerations apply except that stock to compensate for eccentricity is added to the tube OD. (See Example 2, page 97.)

TUBE SIZE CALCULATIONS - continued

Example 1 - Machined True to OD

Operation	Formula	Example
1. Determine maximum tube OD (see Figure 2, page 99)	Maximum machined OD	5.000 in
	Plus cleanup stock	+ .054 in
	Plus camber allowance	+ .027 in
	Plus OD negative tolerance	+ .028 in
	Equals nominal tube OD	<u>5.109 in</u>
	Plus OD positive tolerance	.028 in
	Maximum tube OD size	<u>5.137 in</u>
2. Determine maximum tube ID (see Figure 3)	Minimum machined ID	4.000 in
	Minus cleanup stock	- .042 in
	Minus camber allowance	- .027 in
	Maximum tube ID	<u>3.931 in</u>
		Maximum tube OD (Operation 1)
3. Determine minimum wall required (see Figure 4)	Minus maximum tube ID (Operation 2)	- 3.931 in
	Equals minimum wall size x 2	<u>1.206 in</u>
	Divide by 2	÷ 2
	Minimum tube wall	<u>.603 in</u>
		Minimum tube wall (Operation 3)
4. Determine average wall required (see Figure 6)	Divided by the complement of minus tolerance	÷ .925
	Average tube wall	<u>.652 in</u>
		Minimum tube wall (Operation 3)
5. Determine nominal tube ID (see Figure 6)	Minus average wall doubled (Operation 4)	- 1.304 in
	Nominal tube ID	<u>3.805 in</u>
		15.32 mm
		.925
		÷
	Average tube wall	16.56 mm
	Nominal tube OD (Operation 1)	129.77 mm
	Minus average wall doubled (Operation 4)	- 32.12 mm
	Nominal tube ID	<u>96.65 mm</u>

Guaranteed Tube Size: 5.109 inches OD ± .028 inches x .652 inches ± 7.5% Theoretical Foot Weight: 31.04 lbs

TUBE SIZE CALCULATIONS – continued

Example 2 – Machined True to ID

When machining true to the ID, similar considerations apply, except that stock to compensate for tube eccentricity is added to the tube OD. This will result in a larger recommended tube size.

Operation	Formula	Example
1. Determine minimum tube OD	Maximum machined OD Plus ID cleanup stock Plus camber allowance Minimum tube OD	$\begin{array}{r} 5.000 \text{ in} \\ + .042 \text{ in} \\ + .027 \text{ in} \\ \hline 5.069 \text{ in} \end{array}$ $\begin{array}{r} 127.00 \text{ mm} \\ + 1.07 \text{ mm} \\ + .69 \text{ mm} \\ \hline 128.76 \text{ mm} \end{array}$
2. Determine nominal tube ID	Minimum machined ID Minus minimum OD cleanup Minus camber allowance Minus OD tolerance Minus (if hot rolled) Nominal tube ID	$\begin{array}{r} 4.000 \text{ in} \\ - .054 \text{ in} \\ - .027 \text{ in} \\ - .028 \text{ in} \\ - .030 \text{ in} \\ \hline 3.861 \text{ in} \end{array}$ $\begin{array}{r} 101.60 \text{ mm} \\ - 1.37 \text{ mm} \\ - .69 \text{ mm} \\ - .71 \text{ mm} \\ - .76 \text{ mm} \\ \hline 98.07 \text{ mm} \end{array}$
3. Determine minimum wall required	Minimum tube OD (Operation 1) Minus nominal tube ID (Operation 2) Divide by 2 Minimum tube wall	$\begin{array}{r} 5.069 \text{ in} \\ - 3.861 \text{ in} \\ \hline 1.208 \text{ in} \\ \div 2 \\ \hline .604 \text{ in} \end{array}$ $\begin{array}{r} 128.76 \text{ mm} \\ - 98.07 \text{ mm} \\ \hline 30.69 \text{ mm} \\ \div 2 \\ \hline 15.35 \text{ mm} \end{array}$
4. Determine average wall required	Minimum tube wall (Operation 3) Divide by the complement of minus tolerance Average tube wall	$\begin{array}{r} .604 \text{ in} \\ \div .925 \\ \hline .653 \text{ in} \end{array}$ $\begin{array}{r} 15.35 \text{ mm} \\ \div .925 \\ \hline 16.59 \text{ mm} \end{array}$
5. Determine nominal tube OD	Nominal tube ID (Operation 2) Plus average wall doubled Nominal tube OD	$\begin{array}{r} 3.861 \text{ in} \\ + 1.306 \text{ in} \\ \hline 5.167 \text{ in} \end{array}$ $\begin{array}{r} 98.07 \text{ mm} \\ + 33.19 \text{ mm} \\ \hline 131.26 \text{ mm} \end{array}$

Guaranteed Tube Size: 5.167 inches OD \pm .028 inches \times .653 inches \pm 7.5% Theoretical Foot Weight: 31.48 lbs.

HOT ROLLED MECHANICAL TUBING CLEANUPS FOR FULL SURFACE INTEGRITY AND BASE METAL

Note: Total stock removal is calculated for the tube diameter

FORMULAS FOR CALCULATING SURFACE CLEANUP

Hot Rolled OD Cleanup = $[.022e^{-18.00}]$

NOTE: Minimum cleanup of .040" (.020" per side)

Cold Drawn OD Cleanup = $.86[.022e^{-18.00}]$

Hot Rolled and Cold Drawn ID Cleanup = $.78[.022e^{-18.00}]$

FORMULAS FOR CALCULATING CAMBER (STRAIGHTNESS) CLEANUP

Chucked on one end:

- Part length 3 inches or less—no camber added
- Part length over 3 inches—double the part length to calculate camber.

Chucked on both ends:

- Length 6 inches or less—no camber added
- Length over 6 inches—use formulas below (do not double part length).

Formulas (Calculate all length dimensions in inches):

$$A) \text{ OD } < 5.000 \text{ inches} = \frac{(171 \times \text{length}) - 444 - (1.03 \times \text{length squared})}{100,000}$$

$$B) \text{ OD } \geq 5.000 \text{ inches} = \frac{(222 \times \text{length}) - 222 - (1.13 \times \text{length squared})}{100,000}$$

$$C) \text{ OD } < 5.000 \text{ inches and Part Length } > 60 \text{ inches} = \frac{450 + (25 \times \text{length})}{30,000}$$

D) OD 5.000 inches and Part Length > 60 inches:
Use formula C + .030 inches

No Tolerance Under

STRAIGHTNESS TOLERANCE HOT ROLLED STEEL BARS

Rounds, Squares, Hexagons, Octagons,
Flats, and SpringFlats

Measurement is taken on the concave side of the bar with a straight edge.

Normal Straightness

1/4" (6.35 mm) in any 5 ft. (1.524 m)

and

$$1/4" \times \frac{\text{length in ft.}}{5} \text{ or } 6.35 \text{ mm} \times \frac{\text{length in m.}}{1.524}$$

or

⁽¹⁾3/8" (9.525 mm) in any 5 ft. (1.524 m)

and

$$3/8" \times \frac{\text{length in ft.}}{5} \text{ or } 9.525 \text{ mm} \times \frac{\text{length in m.}}{1.524}$$

Special Straightness

1/8" (3.175 mm) in any 5 ft. (1.524 m)

and

$$1/8" \times \frac{\text{length in ft.}}{5} \text{ or } 3.175 \text{ mm} \times \frac{\text{length in m.}}{1.524}$$

or

Inquire with mill for rounds greater
than 12.500" (317.5 mm).

Note: Because of warpage, straightness tolerances do not apply to bars if any subsequent heating operation or controlled cooling has been performed.

Note: Tolerances shown are based upon ASTM A29.

⁽¹⁾Note: May be applicable to rounds greater than 12" (304.7 mm). Inquire with mill.

MACHINING ALLOWANCE FOR HOT ROLLED BARS

Minimum Stock Removal (diameter)

Standard Grades	1.6% per side
Resulfurized Grades	2.4% per side

Note: Based on bars within special straightness tolerance. Since straightness is a function of length, additional machining allowance may be required for turning on centers.

CALCULATIONS FOR \bar{X} AND R CHARTS AND CAPABILITY

CONTROL CHARTS FOR VARIABLES

Calculate the Average (\bar{X}) and Range (R) of each subgroup

$$\bar{X} = \frac{X_1 + X_2 + \dots + X_n}{n}$$

$$R = X_{\max} - X_{\min}$$

Calculate the Average Range (\bar{R}) and the process Average (\bar{X})

$$\bar{X} = \frac{X_1 + X_2 + \dots + X_k}{k}$$

$$\bar{R} = \frac{R_1 + R_2 + \dots + R_k}{k}$$

Calculate the Control Limits

$$UCL_{\bar{X}} = \bar{X} + A_2\bar{R} \qquad UCL_R = D_4\bar{R}$$

$$LCL_{\bar{X}} = \bar{X} - A_2\bar{R} \qquad LCL_R = D_3\bar{R}$$

PROCESS CAPABILITY

Estimated σ ($\hat{\sigma}$)
 $\hat{\sigma} = \bar{R}/d_2$

Estimated Process Capability (Cp)

$$Cp = \frac{USL - LSL}{6\hat{\sigma}}$$

Estimated Capability Ratio (Cr)

$$Cr = 1/Cp \times 100 (\%)$$

Estimated Process Capability (Cpk)

$$C_{PU} = \frac{USL - \bar{X}}{3\hat{\sigma}} \qquad C_{PL} = \frac{\bar{X} - LSL}{3\hat{\sigma}}$$

$C_{PK} = \text{Minimum of } C_{PU} \text{ or } C_{PL}$

Note: A_2, D_3, D_4, d_2 factors are dependent on subgroup size (n). See factor values table.

Note: Calculations of Process capability (Cp, Cpk, Cr) are only valid for stable processes.

FACTOR VALUES

N	=	2	3	4	5	6	12
D_4		3.27	2.57	2.28	2.11	2.00	1.72
D_3		*	*	*	*	*	0.26
A_2		1.86	1.02	0.73	0.58	0.48	0.27
d_2		1.13	1.69	2.06	2.33	2.53	3.26

* No constant for subgroup sizes below 7.

NORMAL DISTRIBUTION

CONTROL CHARTS FOR ATTRIBUTES

The p Chart

$$\bar{p} = \frac{\text{number of rejects in subgroup}}{\text{number inspected in subgroups}}$$

$$UCL_p = \bar{p} + \frac{3\sqrt{\bar{p}(1-\bar{p})}}{\sqrt{n}}$$

$$LCL_p = \bar{p} - \frac{3\sqrt{\bar{p}(1-\bar{p})}}{\sqrt{n}}$$

The np Chart

np = Number of non-conforming units within a sample

$n\bar{p}$ = Average number of nonconforming units per sample

$$UCL_{np} = n\bar{p} + 3\sqrt{n\bar{p}(1-\bar{p})}$$

$$LCL_{np} = n\bar{p} - 3\sqrt{n\bar{p}(1-\bar{p})}$$

The u Chart

$$\bar{u} = \frac{\text{total nonconformities}}{\text{total units inspected}}$$

$$UCL_u = \bar{u} + \frac{3\sqrt{\bar{u}}}{\sqrt{n}}$$

$$LCL_u = \bar{u} - \frac{3\sqrt{\bar{u}}}{\sqrt{n}}$$

The c Chart

c = The count (number) of nonconformities within a sample

\bar{c} = Average number of nonconformities per sample

$$UCL_c = \bar{c} + 3\sqrt{\bar{c}}$$

$$LCL_c = \bar{c} - 3\sqrt{\bar{c}}$$

IDENTIFICATION OF OUT-OF-CONTROL CONDITIONS (Each point is a subgroup)

HANDY PHYSICAL CONSTANTS

Acceleration of gravity, g	$32.17 \text{ ft/s}^2 = 9.807 \text{ m/s}^2$
Density of water	$62.4 \text{ lbf/ft}^3 = 1 \text{ g/cm}^3$ $1 \text{ gal H}_2\text{O} = 8.345 \text{ lbf}$
Gas Constant, R (STP: 68°F, 1 atm)	$1545 \text{ ft-lbf/pmole-R} = 8.314 \text{ J/gmole-K}$ Gas volume
Constant, J	$359 \text{ ft}^3/\text{pmole} = .02241 \text{ m}^3/\text{gmole}$ Joule's
Poisson's ratio, μ	778 ft-lbf/BTU .3 (for steel)

STEEL CONSTANTS

Fe-Fe ₃ C eutectoid composition	0.77 w/o carbon
Fe-Fe ₃ C eutectoid temperature	1340°F (727°C)
Modulus of Elasticity (steel)	$30 \times 10^6 \text{ psi}$
Densities:	
Carbon & Low-Alloy Steels	$0.283 \text{ lbf/in}^3 = 7.84 \text{ g/cm}^3$
304 SS	$0.29 \text{ lbf/in}^3 = 7.88 \text{ g/cm}^3$
Tool Steels	Carbon Steels $\times 1.000$

milli	m	10^{-3}
micro	μ	10^{-6}
nano	n	10^{-9}

ENGINEERING CONVERSION FACTORS

Explanation of Dimensional Units

All table entries are categorized according to their specific combination of basic dimensions of Length [L], Mass [M] and Time [t]. For example, all units of force have the dimensions $[M][L][t]^{-2}$. The following better illustrates this convention:

$$\begin{aligned}\text{Force} &= [M][L][t]^{-2} \\ &= (\text{Mass}) \times (\text{Acceleration}) \\ 1 \text{ kgf} &= (1 \text{ kg}) \times (9.80665 \text{ m/s}^2)\end{aligned}$$

Example Conversion

Meters to Yards

$$(50 \text{ m}) \times (3.28084 \text{ ft/m}) \times (1/3 \text{ yd/ft}) = 54.68066 \text{ yd}$$

Significant Digit

The convention is to retain the number of digits which correctly infer the known accuracy of the numbers involved. Normally, this means using the same number of significant digits as occur in the original number. For the above example, the answer would therefore be rounded to 55 yards.

When the accuracy of the measurement is known, additional digits may become significant. For example, if the measurement of 50 meters is known to be accurate to .01 meters (.0109 yards), then the conversion result may be rounded to 54.68 yards.

GLOSSARY OF METALLURGICAL TERMS

Alloying Elements

ALUMINUM - Al

is used to deoxidize steel and control grain size. Grain size control is effected by forming a fine dispersion with nitrogen and oxygen which restricts austenite grain growth. Aluminum is also an extremely effective nitride former in nitriding steels.

BORON - B

is usually added between .0005-.003% to significantly increase the hardenability, especially for low carbon alloys. It does not affect the strength of ferrite, therefore not sacrificing ductility, formability or machinability in the annealed state.

CALCIUM - Ca

is used in certain steels to control the shape, size and distribution of oxide and/or sulfide inclusions. Benefits may include improved ductility, impact strength and machinability.

CARBON - C

is the most important alloying element which is essential for the formation of cementite, pearlite, spheroidite, bainite, and iron-carbon martensite. Compared to steels with similar microstructures, strength, hardness, hardenability, and ductile-to-brittle transition temperature are increased with increasing carbon content up to approximately .60%. Toughness and ductility of pearlitic steels are decreased with increasing carbon content.

CHROMIUM - Cr

is used in low alloy steels to increase 1) resistance to corrosion and oxidation, 2) high temperature strength, 3) hardenability, and 4) abrasion resistance in high carbon alloys. Straight chromium steels are susceptible to temper embrittlement and can be brittle.

COPPER - Cu

is detrimental to hot workability and subsequent surface quality. It is used in certain steels to improve resistance to atmospheric corrosion.

LEAD - Pb

improves machinability. It does not dissolve in steel but stays as globules. Environmental concerns are resulting in a decreased usage of lead in the steel industry.

MANGANESE - Mn

is important because it deoxidizes the melt and facilitates hot working of the steel by reducing the susceptibility to hot shortness. It combines with sulfur to form MnS stringers which increases machinability. Manganese contributes to the effectiveness of normalizing for strengthening, to the formation of fine pearlite, and lowers the Ms temperature, therefore increasing the probability of retained austenite.

GLOSSARY - continued**MOLYBDENUM - Mo**

increases hardenability of steels and helps maintain a specified hardenability. It increases high temperature tensile and creep strengths. Molybdenum hardened steels require higher tempering temperatures for softening purposes.

NICKEL - Ni

is used in low alloy steels to reduce the sensitivity of the steel to variations in heat treatment and distortion and cracking on quenching. It also improves low temperature toughness and hardenability.

NIOBIUM - Nb (Columbium - Cb)

lowers transition temperature and raises the strength of low carbon steel. Niobium increases strength at elevated temperatures, results in finer grain size and forms stable carbides, lowering the hardenability of the steel.

NITROGEN - N

increases the strength, hardness and machinability of steel, but it decreases the ductility and toughness. In aluminum killed steels, nitrogen combines with the aluminum to provide grain size control, thereby improving both toughness and strength. Nitrogen can reduce the effect of boron on the hardenability of steels.

PHOSPHORUS - P

is generally restricted to below 0.04 weight percent to minimize its detrimental effect on ductility and toughness. Certain steels may contain higher levels to enhance machinability, strength and/or atmospheric corrosion resistance.

SILICON - Si

is one of the principal deoxidizers with the amount used dependent on the deoxidization practice. It slightly increases the strength of ferrite without a serious loss of ductility. In larger quantities, it aids the resistance to scaling up to 500°F in air and decreases magnetic hysteresis loss.

SULFUR - S

is detrimental to transverse strength and impact resistance. It affects longitudinal properties to a lesser degree. Existing primarily in the form of manganese sulfide stringers, sulfur is typically added to improve machinability.

TITANIUM - Ti

is added to boron steels because it combines with oxygen and nitrogen, thus increasing the effectiveness of boron. Titanium, as titanium nitride, also provides grain size control at elevated temperatures in microalloy steels. In excess, titanium is detrimental to machinability and internal cleanliness.

GLOSSARY - continued

TELLURIUM - Te

is added to steel to modify sulfide type inclusion size morphology and distribution. The resulting sulfide type inclusions are finer and remain ellipsoidal in shape following hot working, thereby improving transverse properties.

VANADIUM - V

inhibits grain growth during heat treating while improving strength and toughness of hardened and tempered steels. Additions up to .05% increase hardenability whereas larger amounts tend to reduce hardenability because of carbide formation. Vanadium is also utilized in ferrite/pearlite microalloy steels to increase hardness through carbonitride precipitation strengthening of the matrix.

Standard Mill Terminology

ANNEALING

A treatment consisting of heating uniformly to a temperature, within or above the critical range, and cooling at a controlled rate to a temperature under the critical range. This treatment is used to produce a definite microstructure, usually one designed for best machinability, and/or to remove stresses, induce softness, and alter ductility, toughness or other mechanical properties.

AUSTENITIZE

The heating of steel above critical temperature to allow the microstructure to transform to austenite. The final microstructure is dependent upon the cooling rate. Austenitizing is required prior to quench and temper heat treatments.

BILLET

A solid semifinished round or square that has been hot worked usually smaller than a bloom. Also a general term for wrought starting stock for forgings or extrusions.

BLINGOT

An ingot that has been rolled to 18 inches by 24 inches and held for later use. Rolling to this size prevents cracking in high carbon grades during cooling when not rolling to a final size

BLOOM

A semifinished hot rolled rectangular product. The width of the bloom is no more than twice the thickness and the cross-sectional area is usually not less than 36 square inches.

DI (Ideal Diameter)

The diameter of a round steel bar that will harden at the center to a given percent of martensite when subjected to an ideal quench (i.e., Grossman quench severity $H = \infty$)

ELONGATION

In tensile testing, the increase in gage length, measured after the fracture of a specimen within the gage length, usually expressed as a percentage of the original gage length.

GLOSSARY - continued

END-QUENCH HARDENABILITY TEST (Jominy Test)

A laboratory procedure for determining the hardenability of a steel or other ferrous alloy. Hardenability is determined by heating a standard specimen above the upper critical temperature, placing the hot specimen in a fixture so that a stream of cold water impinges on one end, and, after cooling to room temperature is completed, measuring the hardness near the surface of the specimen at regularly spaced intervals along its length. The data are normally plotted as hardness versus distance from the quenched end.

HARDNESS

Resistance of a metal to plastic deformation, usually by indentation. However, this may also refer to stiffness or temper, or to resistance to scratching, abrasion, or cutting.

IMPACT TEST

A test to determine the behavior of materials when subjected to high rates of loading, usually in bending, tension or torsion. The quantity measured is the energy absorbed in breaking the specimen by a single blow, as in the Charpy or Izod tests.

INGOT

A casting of a simple shape which can be used for hot working or remelting.

KILLED STEEL

Steel treated with a strong deoxidizer to reduce oxygen to a level where no reaction occurs between carbon and oxygen during solidification

LAP

A surface imperfection which appears as a seam. It is caused by the folding over of hot metal, fins or sharp corners and then rolling or forging them into the surface but not welding them. Laps on tubes can form from seams on piercing mill billets.

MACHINABILITY

This is a generic term for describing the ability of a material to be machined. To be meaningful, machinability must be qualified in terms of tool wear, tool life, chip control, and/or surface finish and integrity. Overall machining performance is affected by a myriad of variables relating to the machining operation and the workpiece. An overall review is provided in the ASM Metals Handbook: Machinability, Ninth Edition, Volume 16, 1989.

NORMALIZING

A treatment consisting of heating uniformly to temperature at least 100°F above the critical range and cooling in still air at room temperature. The treatment produces a recrystallization and refinement of the grain structure and gives uniformity in hardness and structure to the product.

GLOSSARY - continued**PICKLING**

An operation by which surface oxide (scale) is removed by chemical action. Sulfuric acid is typically used for carbon and low-alloy steels. After the acid bath, the steel is rinsed in water.

QUENCHING

A treatment consisting of heating uniformly to a predetermined temperature and cooling rapidly in air or liquid medium to produce a desired crystalline structure.

REDUCTION OF AREA

The difference, expressed as a percentage of original area, between the original cross-sectional area of a tensile test specimen and the minimum cross-sectional area measured after complete separation.

SCAB

An imperfection which is a flat piece of metal rolled into the steel surface.

SEAM

A defect on the surface of a metal which appears as a crack. Experience indicates that most seams are created during the cooling or reheating of cast structures.

SEMI-KILLED STEEL

Incompletely deoxidized steel which contains enough dissolved oxygen to react with the carbon to form carbon monoxide to offset solidification shrinkage.

SPHEROIDIZE ANNEAL

A special type of annealing that requires an extremely long cycle. This treatment is used to produce globular carbides and maximum softness for best machinability in some analyses, or to improve cold formability.

STRAND CASTING (Continuous Casting)

Operation in which a cast shape is continuously drawn through the bottom of the mold as it solidifies. The length is not determined by mold dimensions.

STRESS FREE

A condition in which no stress has been induced in the material after thermal treatment. This term indicates that a process to reduce residual stress has been used but does not imply the total absence of any residual stress in the shipped product. Material heat treated using a continuous line furnace and hot straightened is considered stress free, thereby eliminating the need for a stress relieve operation.

STRESS RELIEVE TEMPER

A thermal treatment to restore elastic properties and to minimize distortion on subsequent machining or hardening operations. This treatment is usually applied to material that has been heat treated (quenched and tempered). Normal practice would be to heat to a temperature 100°F lower than the tempering temperatures used to establish mechanical properties and hardness. Ordinarily, no straightening is performed after the stress relieve temper.

GLOSSARY - continued**TEMPERING**

A treatment consisting of heating uniformly to some predetermined temperature under the critical range, holding at that temperature a designated period of time and cooling in air or liquid. This treatment is used to produce one or more of the following end results: A) to soften material for subsequent machining or cold working, B) to improve ductility and relieve stresses resulting from prior treatment or cold working, and C) to produce the desired mechanical properties or structure in the second step of a double treatment.

TENSILE STRENGTH

In tensile testing, the ratio of maximum load to original cross-sectional area.

WATER BLAST

The removal of scale and other debris from the surface of the material through the use of high-pressure water.

YIELD POINT

The first stress in a material, usually less than the maximum attainable stress, at which an increase in strain occurs without an increase in stress. If there is a decrease in stress after yielding, a distinction may be made between upper and lower yield points.

YIELD STRENGTH

The stress at which a material exhibits a specified deviation from proportionality of stress and strain. An offset of .2% is commonly used.

***Information adapted from ASM
and/or SAE publications.***

GLOSSARY OF FORGING TERMS

AS FORGED

The condition of a forged component when it is removed from the finisher die block cavity without any additional or subsequent operations.

BACKWARD EXTRUSION

The forging or forming process where a metal contained within a die is forced backward or in the opposite direction over a punch producing a blind hole or cup shaped forging.

BLANK

Raw material or forging stock from which a forging is made.

BLOCKER FORGING

The primary forging operation that defines the basic shape of the forging by approximating the components final dimensions and leaving a generous finish allowance and additional.

BOSS

A relatively short projection or protrusion on the surface of a forging, often cylindrical in shape.

BURNING

Metal that has been overheated to an excessively high temperature resulting in permanent damage. Burning occurs by either incipient melting at the grain boundaries or intergranular oxidation.

COLD FORGING

An impression or closed die forging process that is performed at or near room temperature. This process often requires a lubricant to assist with material flow and will produce a close-tolerance, draft-less forging.

COINING

A post-forging process that is used to attain tighter tolerances or to improve the surface finish of the forged components.

DIE BLOCK(S)

Metal block(s) that have been machined with the required forging impressions to produce the forged component.

DIE IMPRESSION

The counter-sunk portion of the die block surface that defines the shape of the forged component.

DIE SINKING

The forming or machining operation that creates the depressed pattern of a die block.

DRAFT

The taper on the sides of the die impression and the associated forging that is required for removal of the component from the die block.

FORGING GLOSSARY – continued**FILLET**

The concave easing of an interior corner of the forging that is used to reduce stress concentration within the component.

FIN

A thin projection formed on a forging when metal is forced under pressure into hairline cracks or die interfaces.

FINISH ALL OVER (F.O.A.)

The designation that a forging has been produced sufficiently larger than the dimensions specified to permit machining to the required size on all surfaces.

FLASH

The excess metal that extends out from the body of the forging to ensure complete filling of the die block impression.

FORGING BILLET

A wrought metal multiple or “mult” used as forging stock.

FORGING STRESSES

Elastic residual stresses induced by part design, forging operations or post-forging cooling. The stresses can be relieved by a subsequent heat treatment such as annealing or normalizing.

FORWARD EXTRUSION

The forcing of metal through a die orifice in the same direction as the force applied.

HAMMER FORGING

A mechanical forging or forming process that shapes the metal by means of a hammer ram striking forging stock that is placed on an anvil, repeated strikes create the components desired shape. The action of the hammer provides instantaneous localized compressive forces that deform the metal. The process also is referred to as Drop Forging and is frequently used during the forging of shafts.

HOT FORGING

A forging process that induces plastic deformation at a specified temperature and strain rate to simultaneously produce recrystallization and metal deformation, thus avoiding strain hardening.

IMPRESSION DIE FORGING

A forging process that utilizes mating dies with shaped impressions to form a component. The process also is referred to as Closed Die Forging.

“MULT” OR MULTIPLE

A single piece of raw material or forging stock used to produce a forging.

FORGING GLOSSARY - continued

OPEN DIE FORGING

A forging process where components are made between a set of flat dies or dies with simple shapes such as "V" or "O" shapes. Shafts, Discs and Saddle/Mandrel Rings are manufactured through this process.

PREHEATING

The heating of a metal to a relatively high temperature for a long period of time to gain a uniform and sufficient soak in order to change the structure before hot working.

PUNCHOUT

The metal that is removed when punching a hole in a forging. This operation is often required during the Ring Rolling process.

RECRYSTALLIZATION

The process by which deformed grains are replaced by a new set of undeformed grains that nucleate and grow until the original grains have been entirely consumed.

RESIDUAL STRESS

Macroscopic stresses that are set up within a metal as the result of non-uniform plastic deformation (i.e. forging). The deformation can be caused by cold working or by drastic temperature gradients created by accelerated cooling operations such as quenching.

RING ROLLING

A forging process that traditionally starts with a hole-punched work piece. The process uses an inner mandrel roll and an outer drive roll. The inner mandrel roll compresses toward the drive roll resulting in a thinner wall and enlarged diameter forging.

ROTARY FORGING

A piercing method that works the metal from the inside and outside. A solid bar is converted to a hollow shell by displacing material over a mandrel during rotary forging.

SADDEN

Light reduction incurred at the initial forging operation to break up and refine the coarse as-cast structure at the surface of an ingot.

SCALE

Oxidation of metal due to heat, resulting in relatively heavy surface layers of oxide.

SEAM (DEFECT)

(1) A crack located on the surface of the metal that has been closed but not welded shut. They are generally formed by a preexisting defect produced during casting or cold/hot working (i.e. laps). (2) A defect on the surface of a metal which appears as a crack, usually resulting from a discontinuity obtained during casting or teeming.

SHEAR

A type of cutting operation in which the metal is cut by means of a moving blade and a fixed edge or by a pair of moving blades.

FORGING GLOSSARY - continued**SHEAR CRACKING**

A diagonal, transgranular crack caused by shear stresses.

SHOT BLASTING

The cleaning of a metal surface through the combination of an air blast and metal shot used as an abrasive.

SHRINKAGE

The contraction of metal that occurs during cooling after hot forging.

SLIVER (DEFECT)

A loose piece of metal or slender fragment that is forged into the surface of a component during the forging operation.

SOAKING

Prolonged heating of a metal at a selected temperature in order to ensure it has achieved a uniform temperature through the entire cross section.

STRAIN

The elastic or plastic deformation of steel caused by stress.

STRAIN HARDENING

An increase in hardness and strength caused by plastic deformation at temperatures lower than the recrystallization range of the material.

STRESS

(1) The deforming load to which a metal is subjected. (2) The resistance which the metal offers to deformation by a force.

TRIMMING

A mechanical shearing operation (hot or cold) that removes the flash or excess material from the forging.

TOLERANCE LIMIT

The permissible deviation from a specified value of any design characteristic.

UPSET FORGING

A forging or forming process that occurs near the end of the bar. The upset occurs between laterally moving dies which increases the diameter of the worked piece by compressing its length.

WARM FORGING

The forging or forming process where metal deformation occurs below the recrystallization temperature. For steels, this temperature can range from 800 to 1800 degrees Fahrenheit.

WORK HARDENING

An increased resistance to deformation (i.e. increase in hardness) produced by cold working.

FORGING GLOSSARY - continued**WORKABILITY**

The characteristic or group of characteristics that determine the ease of forming a metal into a desired shape.

WROUGHT STEEL

Steel that has been produced by thermo-mechanical working or hot deformation.

Customized steel solutions for the toughest challenges

We deliver tailored solutions for customers' most demanding applications. We're known for metallurgy and advanced manufacturing processes that produce some of the cleanest, highest performance steel in the world.

In addition, we offer value-added solutions that help customers reduce costs and test new technology.

For more information, visit www.timkensteel.com or call us at 866.284.6536 (USA), +44 (0) 116 2325186 (Europe), +52 (55) 5876 9888 (Latin America) and +86 (21) 60231080 (China).
