Knowledge Area: Operations Optimization

Sign Up | Stay up to date on this Knowledge Area

Our Objective

WERF will demonstrate that our subscriber wastewater facilities can achieve at least a 20% improvement in wastewater or solids treatment operations through economically and environmentally responsible process optimizations for energy, cost, and/or environmental footprint in a carbon-constrained world. WERF will provide guidance and tools as a decision support system.

Latest News

Energy Production and Efficiency Challenge: Notice of RFP To Be Released
The Water Environment Research Foundation (WERF) plans to issue our third Request for Proposals (RFP) to support the Energy Production and Efficiency research program. The overarching goal of WERF's Energy program is to develop information that will support net energy neutrality at all wastewater facilities that treat flows of five million or more gallons per day (mgd).

EPA Releases Guide to Energy Efficiency in Water and Wastewater Facilities for Local Governments
EPA has released a new climate and energy strategy guide for local governments, titled "Energy Efficiency in Water and Wastewater Facilities: A Guide to Developing and Implementing Greenhouse Gas Reduction Programs." Water and wastewater facilities are among the largest consumers of energy in a community, accounting for 35 percent of typical U.S. municipal energy budgets. Local governments can reduce their energy costs and greenhouse gas emissions by working with these facilities to improve the energy efficiency of their new, existing and renovated buildings and their day-to-day operations. This guide provides comprehensive information for local government staff and policy makers on designing and implementing energy management programs for water and wastewater facilities.

Improving Economics of Codigestion - via BioCycle
(PDF, 1.5 MB) WERF principle investigator David Perry, PhD, discusses why the economics of an organic "waste to energy" facility are strongly dependent on the waste characteristics, and costs of digestion and solids processing after digestion. Click do download.

WERF Research to be Showcased at 2013 WEF Conference in Nashville
WERF researchers will be presenting in the technical sessions on OWSO and Energy research at WEF conferences this May.

New Paradigms for Energy - via TPO Magazine
Energy is a big item on clean-water plant agendas. More and more plant teams are striving to make their facilities energy neutral or even net energy producers. Continue reading at TPOmag.com

OWSO11C10a, Reframing the Economics of Combined Heat and Power (CHP) Projects: Fact Sheet
This fact sheet addresses the financial metrics that can be used to overcome the economic barriers to combined heat and power (CHP) projects. It provides a breakdown of payback period, net present value, benefit cost ratio, internal rate of return, and equivalent uniform annual net value and how they apply to CHP project analysis. Also considers the time value of money, risk analysis, and long-term sustainability. Published by WERF. 8 pages. Printed fact sheet and online PDF. (2012)

USEPA Energy Management Guidebook

Table of Contents

FOREWORD.....	1
OVERVIEW.....	2 to 4
How This Guidebook is Organized.....	5 to 9
Characterization of Your Utility Crosswalk of Plan-Do-Check-Act Approach	
PLAN	
SESSION 1: Getting Ready.....	10 to 18
Module 1: Establish your utility's energy improvement goals	
Module 2: Secure and maintain management commitment, involvement, and visibility	
Module 3: Choose an energy "fence-line"	
Module 4: Establish energy improvement program leadership	
Module 5: Secure and maintain employee buy-in	
Module 6: Communicate results	
SESSION 2: Assessing Current Energy Baseline Status.....	19 to 33
Module 1: Benchmark energy efficiency information	
Module 2: Conduct an energy assessment or baseline audit	
Module 3: Review legal and other requirements and establish a compliance baseline	
SESSION 3: Establishing an Energy Vision and Priorities for Improvement.....	34 to 43
Module 1: Develop an energy policy	
Module 2: Identify activities and operations that consume energy	
Module 3: Prioritize activities/operations and potential energy improvement efforts	
SESSION 4: Identifying Energy Objectives and Targets.....	44 to 50
Module 1: Establish energy objectives and targets	
Module 2: Define performance indicators	
DO	
SESSION 5: Implementing Energy Improvement Programs and Building a Management System to Support Them.....	51 to 62
Module 1: Develop action plans to implement energy improvements	
Module 2: Develop management system "operating controls" to support energy improvements	
CHECK & ACT	
SESSION 6: Monitoring and Measuring Your Energy Improvement Management Programs.....	63 to 71
Module 1: Review what you currently monitor and measure for energy	
Module 2: Determine what else you need to monitor and measure for your priority energy improvement operations	
Module 3: Develop a plan for maintaining the efficiency of energy equipment	
Module 4: Review the progress of your energy targets	
Module 5: Implement actions to adjust or correct when you are not progressing toward your energy goals	
Module 6: Monitor/reassess compliance status	
SESSION 7: Maintaining Your Energy Improvement Programs.....	72 to 76
Module 1: Continue to align energy goals with business/operational goals	
Module 2: Apply lessons learned	
Module 3: Expand involvement of management and staff	
Module 4: Communicate success	
CONCLUSION.....	77
Resources/Tools.....	78
APPENDICES	

Overview – WERF CHEApet Optimization Challenge

The “Optimization” Goal

To develop and demonstrate economical and environmentally responsible processes that improve wastewater and solids treatment operations efficiencies and costs by at least 20%:

- 20% less energy
- 20% more resource recovery
- 20% less solids produced

These goals can be achieved at most WWTPs...

TECHNICAL MANAGEMENT

Benefits of Process Optimization

- Reduce Operating Costs
- Reduce Environmental Impact
- Improve Water Quality/Performance
- Customer Satisfaction
- Operator Satisfaction

Every worthwhile opportunity comes with risks

Risks associated with Process Changes

- 
- Increased costs
 - Permit Violations
 - Customer Complaints
 - Operator Stress

Our goal is to find the appropriate balance of reward/risk.

Step 1- Charter the team (Define project goals and responsibilities)

- Financial Objectives (operational, capital, ROI)
- Risk Tolerance
- Risk Mitigation
- Communication Plan

Step 2 – Collect Data

■ Power

- Demand
- Use
- Power Factor
- Submetering

■ Chemicals

- Coagulants
- Polymers (coagulant aid and dewatering)
- Odor Control

■ Process Data

- Influent/Effluent/Process concentrations
- Treatment removal efficiencies
- Sludge yields
- Mass Balances
- Recycle streams

Step 3 – Develop Models and Key Performance Indicators

Develop Models

- Spreadsheet Tools
- Plant Hydraulics
- Process (Biowin, CHEAPET)

Process

Energy

Chemicals

Solids Handling

Develop Holistic Approach

- Review current operation and maintenance practices NOT JUST “ ELECTRICAL”

Baseline information on all aspects of the facilities from:

- Process data and permit limits
- Electrical usage and rate structures
- Chemical usage and cost
- Assets
- HVAC systems
- Storage capacities
- Solids handling
- Natural gas or Bio gas usage

Safety

Safety

Safety

kg Thickening-Polymer/kg TSS	0.752276959	Base line kg T-Polymer / kg TSS KPI

KPI's need to be site specific
Other plants can provide useful reference points

Step 4 – Identify Opportunities and Prepare Business Case Evaluations

■ Opportunities

- Operational change
- Minor Capital Improvement
- Major Capital Improvement

■ Business Case Evaluation

- Capital Costs
- Operational and Maintenance Costs
- Risks
- Non Economic Benefits

Example

WERF Tool to assist in BCE

Evaluates alternatives and associated benefits and costs in planning and early design stages

Evaluates “what-if” scenarios including Sensitivity Analyses

Estimates GHG emissions and carbon foot print evaluation

Facilitates discussions with regulatory agencies and project stake holders

- MS Excel Based Tool with Built-In Worksheets

- Regional temperature and emission factors

- Volatile solids reduction model

- Parametric costs

- Process and cost analysis functions

- Internal combustion engines (ICE)

- Gas turbines

- Microturbines

- Stirling Engines

- Fuel cells

Step 5 – Prioritize and Develop Implementation Plan

■ Priorities

- Priority 1 – Recommended to achieve majority of energy savings
- Priority 2 – Would provide additional energy savings but have a longer pay back period
- Priority 3 – Would provide for fine tuning of process and some additional power savings

■ Implementation Plan

- Category I—Immediate
- Category II—Short Term 1-3 years or
- Category III—Long Term 3-5 years

Opportunities for Energy Efficiency

High Energy Using Operations	Energy Savings Measures	High Energy Using Operations	Energy Savings Measures
Pumping	<ul style="list-style-type: none"> •Reduce load •Manage load •Water to wire efficiency •Pump selection •Automated control 	Lighting	<ul style="list-style-type: none"> •Motion sensors •T5 low and high bay fixtures •Pulse start metal halide •Indirect fluorescent •Comprehensive control for large buildings
Aeration	<ul style="list-style-type: none"> •Fine bubble •Improved surface aerators •Premium motors •High efficiency motor drive •Blower Control •Automatic DO control 	Heating, Ventilation, Air Conditioning (HVAC)	<ul style="list-style-type: none"> •Water source heat pumps •Custom incentives for larger units •Low volume fume hoods •Occupancy controls •Heat pump for generator oil sump

Understand Your Power Bill

Power Bill Components:

- Demand
- Ratchet Demand
- Use
- Power Factor
- Fuel
- Time of Use

Meet with your local power provider to understand your rate structure and develop strategies to reduce costs

Energy Savings – Operational Changes

Demand Management – Shed equipment during peak energy use.

Energy Reduction– Monitor DO in aeration basins and maintain at 2 mg/l or less

Time of Use – Consider shifting activities during night shift

Develop benchmarks and closely monitor

Energy Savings – Minor Capital Improvements

- Demand Management – Automation routines to shed non vital equipment
- Energy Reduction – Automated DO control for aeration basins
- Power Factor – Install capacitor banks to increase PF

Energy Savings – Major Capital Replacements

- Replace Aeration Diffusers
- Replace Blowers
- Replace Pumps
- Replace Motors
- Install Cogeneration System
- System Wide (real time) Energy Optimization Systems

Cogeneration and Fog Project At F. Wayne Hill WRC In Gwinnett County, Ga

CH2M HILL worked in partnership with Gwinnett County DWR on the implementation of a cogeneration and FOG receiving facility at the F. Wayne Hill WRC and assisted in the identification in up to \$8.5 million in funding from grant sources.

120_Metro_PM_02

Energy Savings - Plant Compressed Air Systems

■ Baseline

- Compress and dry air used for Pneumatic Primary Sludge Pumps and other controls
- Maintenance issues with compressor cooling system
 - Required 500,000 gpd of potable (softened water)
 - New close loop heat exchanger with air cooled or reclaim water

■ Recommended Action Plan

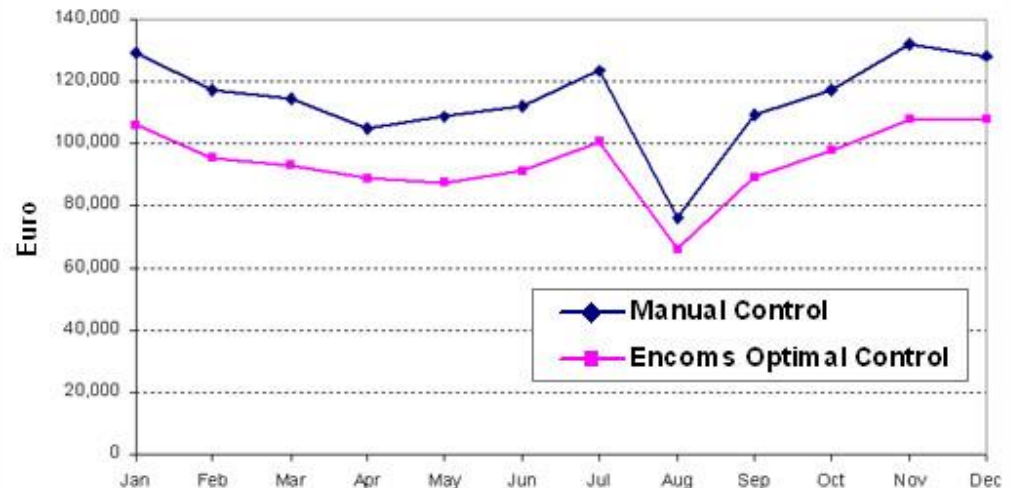

- Re-size new air compressor (25% of original) which allows air cooled unit
- Savings/Benefits: 50% overall power costs, no softened water required, minimal maintenance
- Allows resizing and possible elimination of air gap tank and associated pumps

Energy Savings (cont)

- System Wide (real time) Energy Optimization Systems

Resulting from groundbreaking advances in combined use of genetic algorithms and artificial neural networks, ENCOMS identifies in realtime the optimal operational control settings that will best meet not only the current demands but also the projected ones along the operating horizon (typically 24 hours) at maximum cost savings, taking account of the electricity rate structure, system operational constraints, and demand projections. The real-time control process operates continually and is updated at periodic intervals by SCADA data and new demand forecasts.

Comparison of monthly operating costs

ENCOM: Energy Cost Minimization System

Case Studies - 20% saving

Solids Handling – Operational Changes

- Dewatering polymer optimization
- Continuously evaluate best deal for disposal
- Process Changes (SRT/Digestion)
- Develop benchmarks and closely monitor

Solids Handling – Capital Improvements

- Replace Solids Process Technology
- Replace Dewatering Equipment
- WERF LCAMER (Life Cycle Assessment Manager for Energy Recovery) tool

LCAMER OUTPUT

	Internal Combustion Engine		Gas Turbine	Micro Turbine	Fuel Cell

118_Metro_PM_01

Chemical Savings - Operational

- Develop benchmarks and closely monitor
- Frequent calibration checks
- Tune Control Loops

Chemical Savings - Capital

- New Disinfection System (i.e UV, onsite hypo generation)
- Improved Chemical Mixing (i.e water champs or statiflo)
- Chemical Feed Modifications
- New Odor Control (ie. Biofilters)

Plant Flow Rate (MGD)	Daily Hypochlorite Usage (gallons)	Daily Bisulfite Usage (gallons)	Hypochlorite Cost Per Day	Bisulfite Cost Per Day	Seasonal Chemical Costs	UV Power Requirement (kW)	UV Cost Per Day	UV Lamp Replacement	Seasonal UV Costs	Annual Savings w/ UV

UV Power consumption kW/MGD treated						\$	2.31			
Hypochlorite feed rate, mg/l (historical)							4.5			

Process Changes

Consider Holistic Effects of Any Process Changes

Variables:

- Units in service
- Processes In Service
- MCRT/SRT
- Solids Processing Objectives

Example

NSU - Configuration	Available	Current	Alt. No. 4
Aeration Basins	2.0	2.0	1.0
Aerobic Digesters	4	4	4

NSU - Process	Current	Alt. No. 4	Range	Typical
Cake Solids, % -	15.5	15.9	15-23	18
Polymer Use, lbs/ton -	20.0	20.0	8-20	10
Run Time, hrs/d -	8.0	8.0		

NSU - Performance	Actual	Current	Alt. No. 4	Range	Typical
SRT, days =		26.0	9.8	10-30	15
HDT wo/RAS, hrs. =		43.9	18.9	8-36	12
Clarifier Slids Loading, Lbs/D/SF =		15.3	19.7	5-24	12
Belt Press Hydraulic Loading, gpd/U =		98848	112892	57k-115K	
Belt Press Solids Loading, lbs/d/U =		7672	9483	4.8k-9.6k	
Solids Produced lbs/day	3222.0	3260.7	4702.1		
Solids Produced cy/day =	12.6	12.8	17.9		

NSU - Costs	Actual	Alt. No. 4	Savings
CHEMICALS	\$ 15,431	\$ 22,009	\$ (6,578)
CONTRACT HAULING COSTS	\$ 161,280	\$ 228,750	\$ (67,470)
ELECTRICITY	\$ 401,047	\$ 323,261	\$ 77,786
Total	\$ 577,758	\$ 574,020	\$ 3,738

Evaluate Best Case and Worst Case Scenarios

Current Strategy

- One Large Oxidation Ditch
- Three Aerobic Digesters

Alternative No. 3

- One Small Oxidation Ditch
- Two Aerobic Digesters

	Current	No. 3 Best Case	Savings
CHEMICALS	\$ 9,843	\$ 7,209	\$ 2,635
CONTRACT HAULING COSTS	\$ 103,893	\$ 101,740	\$ 2,153
ELECTRICITY	\$ 207,815	\$ 125,924	\$ 81,891
Total	\$ 321,551	\$ 234,873	\$ 86,679

	Current	Worst Case	Savings
CHEMICALS	\$ 9,843	\$ 9,536	\$ 308
CONTRACT HAULING COSTS	\$ 103,893	\$ 121,128	\$(17,235)
ELECTRICITY	\$ 207,815	\$ 127,437	\$ 80,378
Total	\$ 321,551	\$ 258,101	\$ 63,450

Consider Holistic Operational Affects

- 
- Based on analysis Alternative No. 4 shows the lowest overall operating cost. However, the analysis shows that using only one small oxidation ditch will not provide the horse-power requirements to meet oxygen demands. Therefore this alternative is not viable.
 - Alternative No. 3 is the lowest cost viable option and meets all design criteria.
 - Increased process control and monitoring will be critical to success (higher frequency of testing, added testing locations, effective wasting program).
 - Monitoring of all cost related factors such as quantities, dosages, and unit cost of chemicals and biosolids disposal.
 - A control procedure for operating with only two aerobic digesters must be develop and staff trained on how it should be implemented.
 - Due to increase sludge production the belt press will have to be operated daily for 8 hours.

WERF CHEApet Tool basics

- Provides mass, energy and thermal balances as well as carbon footprint (GHG emissions)
- Tool Platform - Static whole wastewater & STP plant simulator
- Tool Delivery - Online (internet) tool hosted by WERF
 - MS Excel™ Based
- It will be available to WERF subscribers
 - You can download your inputs and outputs but not the tool

Summary

- 
- Utilize WERF and network with other utilities to identify opportunities to optimize your plants
 - Work with power company to understand your bill and identify ways to reduce costs
 - When making changes, evaluate risks and look for unintended consequences
 - Work with chemical suppliers to find more cost effective ways to solve the problem
 - Develop benchmarks and monitor process data
 - Develop Business Case Evaluation Process to prioritize capital projects based on payback and noneconomic benefits
 - Many financing options available – but understand benefits and risks
