Industrial Oils

Industrial lubricants have an important task in the generation and transmission of energy, in the reduction or transmission of drive forces, in the deployment of machine tools, when generating cooling air or compressed air and for many other applications in production. FUCHS industrial lubricants can make a significant contribution to achieving higher productivity, improving efficiency and saving energy, for example in hydraulic systems, gear units and many other applications. Furthermore, rapidly biodegradable lubricants from FUCHS present a real alternative to hydrocarbon-based lubricants.

Greases

Lubricating greases are consistent lubricants made up of base oil and a specially chosen thickener. To increase certain properties, additives are added to the lubricating greases. Lubricating greases are structural elements, especially when used as long-life lubricants for lifetime lubrication. **RENOLIT** industrial lubricating greases are a balanced and complete package offering the ideal technical and economical solution in the largest possible number of lubricating grease applications in industry.

Cutting Fluids

Today, a modern cutting fluid is subjected to a variety of demands. Cooling lubricants for metalworking processes must be effective, economical and free from ingredients that are harmful to health and the environment. In process chains downstream of metalworking, customized cleaning agent solutions and process-compatible and reliable corrosion preventatives play a decisive role when it comes to production reliability and product quality. That's why optimally matched lubricant concepts are important – because all process steps must be taken into account. With its comprehensive range of lubricants and its many years of application experience, FUCHS understands the processes of its customers like no other lubricant manufacturer.

ECOCOOL, ECOCUT

Quenching Products

Fluids are highly important in the area of heat treatment in particular: the required microstructure compositions and degrees of solidity can only be achieved with the right quenching medium. An altered quenching characteristic has a direct effect on the hardened microstructure, on the properties of the material and thereby also on its later deployment. Place your trust in a partner that understands the full heat treatment process, that uses that knowledge to advise you and provides you with system solutions – to your benefit.

THERMISOL

Cleaner

When manufacturing metal products, all materials that have a negative impact on the subsequent production steps or disrupt the later use of the metallic object must be removed from the surfaces. In addition to an extensive consulting, FUCHS offers everything from a single source. Perfectly matched products together with a comprehensive spectrum of industrial cleaners ensure a high level of process safety by avoiding product incompatibility as well as delivering excellent performance in virtually all cleaning processes.

RENOCLEAN

Corrosion Preventives Forming Lubricants

Corrosion protection measures must be optimally compatible with upstream process steps and the products used there. Our recommendation: the compatible **ANTICORIT** corrosion protection products. A wide range of film types is available, from oily to vaseline-type or waxy films. If no film is desired, we solve your corrosion protection problems with our complete VCI range comprising papers, foils, tablets, foams and many other special solutions.

Examples for Key Technologies

RENOLIN XTREMETEMP INDUSTRIAL OILS

RENOLIN XtremeTemp hydraulic oils have a particular position on the market, especially from the point of view of sustainability. Due to their special formulation, they show remarkably high fuel savings potential of 3 to 6% in mobile hydraulics.

RENOLIN ZAF B HT INDUSTRIAL OILS

The RENOLIN ZAF B HT range excels through high thermal and oxidative resistance and excellent wear-protection characteristics. In combination with selected mineral oil-based solvent raffinates, the innovative zinc-free and ash-free additive technology guarantees excellent hydraulic and gear oil properties.

RENOLIN VCI CLP INDUSTRIAL OILS

The new RENOLIN VCI CLP oils are high performance industrial gear oils that combine the properties of a high performance gear oil with reliable corrosion protection. Thanks to their vapor phase corrosion protection, RENOLIN CLP VCI oils guarantee reliable long-term protection and are used in industrial gear boxes that have long downtimes or are stored for an extended period of time.

ECOCOOL PHH AL COOLING LUBRICANT

With ECOCOOL PHH AL, FUCHS has developed a universally deployable cooling lubricant for aerospace applications that is suitable for all kinds of material groups, is boron-free and fulfils the requirements of REACH and TSCA. Beside the standard market engine materials (titanium, nickel and aluminium alloys), the test also had to be passed for older high-strength steels to be approved for use at Lufthansa Technik.

ANTICORIT CPX®

LONG-TERM CORROSION PREVENTION

With its ANTICORIT CPX® range, FUCHS has developed a new formulation category for long-term corrosion protection (10 years). This new wax system guarantees controlled runoff inhibition, both at increased temperatures and at normal ambient temperatures, without compromising penetration into gaps and flanges. It also easy to remove. Individual parameters – such as drying time, run-off tendency, period of corrosion protection and film flexibility – can be customized according to customer requirements. CPX® technology is extremely versatile and suitable for a whole host of different applications, whether cavity protection, long-term warehousing or transport protection.

INDUSTRIAL OILS

Many processes in the industry work perfectly only with specially tailored lubricant solutions.

For example, in the transmission of energy by pressure media (hydraulic fluids), in the gearing of driving forces (gear oils), in the power generation in power plants (turbine oils), at refrigeration (refrigeration oils) or compressed air production (air compressor oils) the respective industrial oils have a significant task.

In addition, FUCHS industrial lubricants can make a significant contribution to a improved productivity in many other applications. They can increase efficiency significantly and reduce energy consumption and associated CO₂ emissions.

Low Varnish turbine oils e.g. ensure trouble-free operation of power plants. Refrigeration oils adjusted to environmentally neutral refrigerants improve the environmental balance in the cold chain. Rapidly biodegradable lubricants are a powerful alternative to hydrocarbon-based lubricants.

GREASES

Greases are viscous, tough to solid lubricants. By selecting suitable oils, thickeners and additives, the properties of the lubricating greases can be optimally adjusted for the most diverse applications with the corresponding experience and know-how.

For example, there are greases for high or very low temperatures, for applications in vacuum, particularly water-resistant and weatherproof, particularly pressure-resistant or capable of creep, rapidly biodegradable or particularly adhesive greases.

With the RENOLIT and PLANTO lubricating greases from FUCHS, you have one of the largest grease ranges on the market - for almost all applications and requirements and for the best possible technical and economical solutions.

CUTTING FLUIDS

In modern production, the requirements for a cooling lubricant have grown considerably. Within the framework of Industry 4.0, a network of the entire value-added chain of man, machine, plant, logistics and cutting fluids shall be achieved and optimized, to enable a self-organized production using modern information and communication technology to a large extent.

For this purpose, cooling lubricant measurement data must be recorded online, evaluated and corresponding maintenance must be implemented. In order to be able to analyze the measurement data with sufficient accuracy cutting fluids of high stability are required.

FUCHS is the worldwide specialist for metalworking. Our cutting fluids can be applied safely and in a stable way. They meet all legal requirements and ensure a long service life, also with boron-free products. They stand for highest cutting performance and outstanding finish quality.

QUENCHING FLUIDS

Particularly in the field of heat treatment, fluids play a central role. Only if the optimum quenchant is selected, can the required microstructure and strength be achieved.

Any change to the quenching rate has an effect on the microstructure, on the properties of the material and thus on its later use.

Apart from the selection of the right quenchant, precise control over the corresponding process parameters is crucial for optimum heat treatment results. Only the perfect matching of all the hardening process parameters can guarantee consistent and warp-free heat treatment results.

Trust a partner who understands all the facets of heat treatment, who is glad to advise you and who can offer you the very best system solutions for perfect results.

Quenching Oils based on Mineral Oil					
THERMISOL QB 32	31	0.87	231	50 – 90	Quenching oils based on mineral oil are usually conventional solvates containing a relatively low level of additives. These oils are generally used to quench components made of high-alloy materials and with simple geometries. They are mainly used for the heat treatment of distortion-resistant components.
THERMISOL QB 46	46	0.87	220	50 – 100	
High-performance Quenching Oils based on Mineral Oil					
THERMISOL QH 10	12	0.85	178	50 – 80	High performance quenching oils usually contain high levels of additives and special agents which accelerate component wetting. High performance quenching oils are normally based on conventional solvates. They are widely used because optimized wetting behaviour makes them suitable for warp-prone components. Depending on the flash point, these quenching oils can also be used as hot bath and martempering oils.
THERMISOL QH 40	45	0.87	234	50 – 110 (max. 150)	
THERMISOL QH 120	119	0.89	256	50 – 170 (max. 200)	
THERMISOL QWA 460	503	0.90	328	100 – 180 (max. 275)	
High-performance Quenching Oils based on Hydrocrack Oil					
THERMISOL QH 10 MC	11	0.84	172	50 – 80	High performance quenchant based on high-quality, low evaporation and low-aromatic hydrocracked oils. MC - the key is a special manufacturing process in which natural mineral oil is converted by hydrocracking, i.e. under high pressure and high temperatures in the presence of H ₂ (hydrogen). This creates a more cost-effective base oil which is comparable to synthetic oils. This base oil together with high-quality additives combines the oxidation stability and the optimum wetting properties of high-performance quenching oils with the thermal stability and extremely low evaporation of hydrocracked oils. The new development THERMISOL QH 35 MC is a universal high-performance quenching oil with best performance values and high process reliability.
THERMISOL QH 30 MC	26	0.84	220	50 – 100 (max. 150)	
THERMISOL QH 35 MC	37	0.85	236	40 – 100 (max. 150)	
Synthetic High-performance Quenching Oils					
THERMISOL QHY 10	11	0.87	204	50 – 130	The use of these quenching oils based on synthetic esters is particularly recommended for highly warp-prone components. Apart from their sustainability credentials, these high-performance quenching oils offer a number of other advantages. Synthetic high-performance quenching oils have significantly better wetting properties than their conventional counterparts. These excellent wetting properties ensure that the vapour phase over the whole surface of the component being treated collapses rapidly. This almost simultaneous wetting of the entire component surface significantly reduces the temperature gradients created during quenching and thus ultimately the uneven shape changes known as warping. Depending on the flash point, these quenching oils can also be used as hot bath and martempering oils.
THERMISOL QHY 35	36	0.93	226	60 – 270	
THERMISOL QHY 150	145	0.93	312	60 – 260

CLEANER

During the manufacturing process, the surface of a workpiece comes into contact with a wide variety of substances. Although these facilitate processing, their residues can cause errors and errors during subsequent processing.

The cleaning of semi-finished products and intermediates is necessary to remove residues, abrasions and impurities from previous work steps. Only then the parts will have the required degree of purity for subsequent operations or storage.

The RENOCLEAN product range from FUCHS offers cleaners for a large number of different processes and applications, and ensures convincing cleaning performance with high efficiency.

CORROSION PREVENTIVES

Unprotected, bare metal surfaces lose their elaborated finish quality often due to corrosion, in particular oxidation. This is not only a deterioration of the look-and-feel, but often a loss of proper function.

The ANTICORIT products from FUCHS are temporary corrosion preventives that can be easily removed if necessary without damaging the surfaces to be protected.

ANTICORIT corrosion preventives have been developed under careful consideration of all conditions, both in the laboratory and in practice. They are simple and economical to use and, adapted to the diverse requirements of the practice, are available in a comprehensive product range.

FORMING LUBRICANTS

The success of a perfect metal forming depends on three factors: the material, the forming process including the tools being used and last but not least the forming lubricant. FUCHS offers lubricants for almost all forming processes. They stand for highest quality and excellent application results - no matter whether for drawing/deep drawing, punching, fine blanking, cold extrusion, wire-, tube- and bar drawing or hydroforming. With RENOFORM and WISURA forming lubricants you maximise efficiency, durability and plant safety. You minimise wear, the environmental impact and follow-up costs. By using our highly effective FUCHS lubricant formulations, you optimise your forming processes all along the line.
