## Production and Resource Use Supply Side

## Chapters 3, 4, and 6

Review - Where We are Going $\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Review - Demand

$\qquad$

- Started with Utility Theory
- Marginal utility
- Consumer equilibrium - The law of demand
- Indifference curves
- Budget constraint
- Individual vs. Market Demand curve
- Change in quantity demanded vs. change in demand
- Shifters of demand
- Use of Demand
- Consumer surplus - consumer welfare
- Elasticities - own price, income, cross price

## Topics of Discussion

- Conditions of perfect competition
- Classification of inputs
- Important production relationships (for one variable input -TPP, APP, MPP)
- Assessing short run business costs (TC, AC,TVC, AVC, MC)
- Economics of short-run decisions

## Topics of Discussion

- Expand production concepts to two inputs $\qquad$
- Concepts are analogous consumers
- Isoquants - Indifference curves $\qquad$
- MRTS - MRS
- Iso-cost lines - Budget constraint
- Least cost combinations - Consumer equilibrium
- Firm Specific
- Production Possibility Frontier
- Iso-revenue
- Long-run firm size

## Conditions for Perfect Competition

- Homogeneous products
- Products from different producers are perfect substitutes
- No barriers to entry or exit
- Resources are free to move in and out of the sector $\qquad$
- Large number of buyers and sellers
- No market power - price takers $\qquad$
- Perfect information
- Including quantities, prices, quality, sources of resources etc.

## Classification of Inputs

- Land - includes renewable (forests) and nonrenewable (minerals) resources
- Labor - all owner and hired labor services, excluding management
- Capital - manufactured goods such as fuel, chemicals, tractors and buildings
- Management - production decisions designed to achieve specific economic goal

## What Are Production Functions?

$\qquad$

- Mathematical relationship that characterizes the physical relationship between the use of inputs and the level of outputs

Output $=\mathrm{f}$ (labor $\mid$ capital, land, and

## Total Physical Production (TPP) Curve

| Pickers | Corn <br> Dozen |
| :---: | :---: |
| 0 | 0 |
| 1 | 5 |
| 2 | 20 |
| 3 | 45 |
| 4 | 75 |
| 5 | 103 |
| 6 | 120 |
| 7 | 130 |

| 7 | 130 | 10 |
| 8 | 136 | 6 |
| 9 | 136.1 | 0.1 |
| 10 | 125 | -11.1 |

- The change in the level of output associated with the change in the use of an input
- MPP $=\frac{\Delta \text { output }}{\Delta \text { input }}$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## MPP Graphically

- Three segments

## Law of Diminishing Marginal Product - Know

"As successive units of a variable input are added to a production process with the other inputs held constant, the marginal physical product (MPP) eventually declines"
$\qquad$

| Pickers | Corn <br> Dozen | APP |
| :---: | :---: | :---: |
| 0 | 0 | $=0 / 0=--$ |
| 1 | 5 | $=5 / 1=5$ |
| 2 | 20 | $=20 / 2=10$ |
| 3 | 45 | $=45 / 3=15$ |
| 4 | 75 | $=75 / 4=18.75$ |
| 5 | 103 | 20.6 |
| 6 | 120 | 20 |
| 7 | 130 | 18.57 |
| 8 | 136 | 17 |
| 9 | 136.1 | 15.12 |
| 10 | 125 | 12.5 |

- Represents the output per unit of input
- Always positive except at zero input - not defined - Why
- $\mathrm{APP}=\frac{\text { total output }}{\text { total input }}$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## APP Graphically

$\qquad$

## Stages of Production

$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Relationships - Know

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Pickers per Day

## Short-Run Costs

$\qquad$

- Fixed costs - do not vary with the level of input use
- Variable costs - vary with the level of input use
- Similar to production can obtain curves such as total, average, and marginal costs

## Total Costs

- Fixed costs \$700 / day
- Cost $\$ 150$ / picker / day $=\$ 18.75$ / hour

| Pickers | Corn <br> Dozen | Fixed <br> Costs (FC) | Total Variable <br> Costs (TVC) | Total Costs <br> TC = FC + TVC |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 700 | $0 \times 150=0$ | $700+0=700$ |
| 1 | 5 | 700 | $1 \times 150=150$ | $700+150=850$ |
| 2 | 20 | 700 | $2 \times 150=300$ | $700+300=1000$ |
| 3 | 45 | 700 | $3 \times 150=450$ | $700+450=1150$ |
| 4 | 75 | 700 | $4 \times 150=600$ | $700+600=1300$ |
| 5 | 103 | 700 | 750 | 1450 |
| 6 | 120 | 700 | 900 | 1600 |
| 7 | 130 | 700 | 1050 | 1750 |
| 8 | 136 | 700 | 1200 | 1900 |

Total Costs - Graphically

## Average Costs

- Average = cost of interest / output

| Corn <br> or <br> Output | Fixed <br> Costs | Total <br> Variable <br> Costs | Total <br> Costs | AFC <br> FC/output | AVC <br> TVC/output | ATC <br> TC/output |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 700 | 0 | 700 | $700 / 0=?$ | $0 / 0=?$ | $700 / 0=?$ |
| 5 | 700 | 150 | 850 | $700 / 5=140$ | $150 / 5=30$ | $850 / 5=170$ |
| 20 | 700 | 300 | 1000 | $700 / 20=35$ | $300 / 20=15$ | $1000 / 20=50$ |
| 45 | 700 | 450 | 1150 | $700 / 45=15.5$ | $450 / 45=10$ | $1150 / 45=25.6$ |
| 75 | 700 | 600 | 1300 | $700 / 75=9.3$ | $600 / 75=8$ | $1300 / 75=17.3$ |
| 103 | 700 | 750 | 1450 | 6.8 | 7.2 | 14.1 |
| 120 | 700 | 900 | 1600 | 5.8 | 7.5 | 13.3 |
| 130 | 700 | 1050 | 1750 | 5.3 | 8.1 | 13.5 |
| 136 | 700 | 1200 | 1900 | 5.1 | 8.8 | 14 |

## Average Costs - Graphically

## Marginal Costs

Marginal costs $=$ change in total costs $/$ change in output

| Corn <br> Dozen | Total Costs | Marginal Costs |
| :---: | :---: | :---: |
| 0 | 700 | -- |
| 5 | 850 | $(850-700) /(5-0)=30$ |
| 20 | 1000 | $(1000-850) /(20-5)=10$ |
| 45 | 1150 | $(1150-1000) /(45-20)=6$ |
| 75 | 1300 | $(1300-1150) /(75-45)=5$ |
| 103 | 1450 | 5.4 |
| 120 | 1600 | 8.8 |
| 130 | 1750 | 15 |
| 136 | 1900 | 25 |

## Marginal Costs - Graphically

## Relationships - Know

## Cost / Production Relationships

$\qquad$

- MC
- Increasing MC is associated with diminishing marginal returns - decreasing MPP
- Decreasing MC is associated with increasing MPP
$\qquad$
- AVC and ATC
- Decreasing AVC \& ATC are associated with increasing APP
- Increasing AVC \& ATC are associated with decreasing APP
- FC
- Decreasing AFC is associated with a constant FC and increasing output

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Short-Run Decisions

Similar to what we have been doing $\qquad$

- Total Revenue = price x quantity - WHY?
- Average Revenue - revenue per unit of output
- Marginal Revenue - change in total revenue as output changes

$$
A R=\frac{\text { total revenue }}{\text { total output }} \quad M R=\frac{\Delta \text { revenue }}{\Delta \text { output }}
$$

- Objective maximize economic profits given something is held fixed

## Economic Profits

- Recall price of $\$ 20 /$ dozen Note, MR $=\frac{\Delta \text { revenue }}{\Delta \text { output }}$

| Corn <br> Dozen | TC | MC | Total Revenue <br> $\mathbf{P ~ x ~ Q ~}$ | MR | Economic Profit <br> TR - TC |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 700 |  | $0 \times 20=0$ |  | $0-700=-700$ |
| 5 | 850 | 30 | $5 \times 20=100$ | $(100-0) /(5-0)$ <br> $=20$ | $100-850=-750$ |
| 20 | 1000 | 10 | $20 \times 20=400$ | $(400-100) /(20-5)$ <br> $=20$ | $400-1000=-600$ |
| 45 | 1150 | 6 | $45 \times 20=900$ | 20 | $900-1150=-250$ |
| 75 | 1300 | 5 | $75 \times 20=1500$ | 20 | $1500-1300=200$ |
| 103 | 1450 | 5.4 | 2060 | 20 | 610 |
| 120 | 1600 | 8.8 | 2400 | 20 | 800 |
| 130 | 1750 | 15 | 2600 | 20 | 850 |
| 136 | 1900 | 25 | 2720 | 20 | 820 |

## Level of Output MC = MR

- Perfect competition in the short run produce at the point MC = MR

## Level of Output MC = MR

- Why? Examine MR and MC curves

## Profit Maximizing Point

- Why not exact?

| Corn <br> Dozen | TC | MC | Total <br> Revenue | MR | Economic Profit <br> TR - TC |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Profit max occurs between the two red rows |  |  |  |  |  |
| 120 | 1600 | 8.8 | 2400 | 20 | 800 |
| 130 | 1750 | 15 | 2600 | 20 | 850 |
| 136 | 1900 | 25 | 2720 | 20 | 820 |
| Approximate profit max point |  |  |  |  |  |
| 134 | 1825 | $\sim 20$ | 2680 | 20 | 855 |
|  |  |  |  |  |  |

## Revenue Side

- Covered by the HW 5, know how to $\qquad$ calculate total revenue, MR, and economic profit tables. $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## TR and TC Areas

$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Economic Profits

## Breakeven Price

- Breakeven price - price that just covers total costs
- TR = TC implies economic profits are zero

Shutdown Price

- Shutdown price - price that just covers total variable costs

## Shutdown Price

- Fixed costs are not covered but variable costs covered

At a price of $\$ 3$ should you produce? Label TC, TR, and profits.

Shutdown Price - WHY?

Breakeven Price - WHY?

At a price of $\$ 3$ should you produce? YES in the short run price above shutdown price - covering some of fixed costs.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Firm's Short-Run Supply Curve

- MC curve above the AVC

## Own-Price Elasticity of Supply

$\qquad$

- Measures the relationship between change in $\qquad$ quantity supplied and a change in price

| Own-price <br> Elasticity <br> of Supply |
| :---: |

$\qquad$
$\qquad$

$$
=\frac{\left(\mathrm{Q}_{\mathrm{SA}}-\mathrm{Q}_{\mathrm{SB}}\right) /\left[\left(\mathrm{Q}_{\mathrm{SA}}+\mathrm{Q}_{\mathrm{SB}}\right) / 2\right]}{\left(\mathrm{P}_{\mathrm{A}}-\mathrm{P}_{\mathrm{B}}\right) /\left[\left(\mathrm{P}_{\mathrm{A}}+\mathrm{P}_{\mathrm{B}}\right) / 2\right]}
$$

$\qquad$
$\qquad$
$\qquad$

## Own-Price Elasticity of Supply

$\qquad$

- Positive - Why?

| If the elasticity is | Supply is | $\% \Delta$ in quantity is |
| :---: | :---: | :---: |
| Greater than $\mathbf{1 . 0}$ | Elastic | Greater than \% $\Delta$ in price |
| Less than 1.0 | Inelastic | Less as \% $\Delta$ in price |
| Equal to 1.0 | Unitary | Equal to \% $\Delta$ in price |
| Equal to 0 | Perfectly <br> inelastic | Zero <br> Vertical supply curve |
| Equal to positive <br> infinity | Perfectly <br> elastic | $\% \Delta$ in price $=$ zero <br> Horizontal supply curve |

## Math Details

- Recall change in quantity $=3$ to 4.5 and price 1 to 1.5 $\qquad$
$\frac{\% \text { change in quantity }}{\% \text { change in own price }}=$

$$
\frac{(4.5-3) /[(4.5+3) / 2]}{(1.5-1) /[(1.5+1) / 2]}=\frac{0.4}{0.4}=1.0
$$

- Interpretation -- 1\% increase in price leads to a $1 \%$ increase in quantity supplied over this arc

## Determinants

$\qquad$

- Availability of raw materials
- Limited availability - less opportunities to respond
- Length and complexity of the production process
- Less production time and complexity - more opportunities to respond
- Time to respond
- Short vs. long run - long run more able to respond
- Excess capacity
- Unused capacity can and will respond quicker
- Inventories
- If have inventory can quickly increase supply to market

## Elasticity

- We have discussed all types of elasticities. By this point you should be able to pick up new elasticity on your own. This is what college is about! As such be sure to understand:
- Elasticity of supply of inputs -- p. 104
- Cross-price elasticity of supply -- p. 105

## Long Run Average Cost Curve

The long run average cost (LAC) curve reflects points of tangency with a series of short run average total cost (SAC) curves. The point on the LAC where the following holds is the long run equilibrium position $\left(\mathrm{Q}_{\mathrm{LR}}\right)$ of the firm:

$$
\mathrm{SAC}=\mathrm{LAC}=\mathrm{SMC}=\mathrm{P}_{\mathrm{LR}}
$$

where $P_{\text {LR }}$ represents the long run price and SMC short run marginal costs.

## Developing the LAC

## Economies of Size

- Increasing returns to size - increase in output is more than proportional increase in input use
- LAC is decreasing when firm is expanded $\qquad$
- Decreasing returns to size - increase in output is less than proportional increase in input use - LAC is increasing when firm is expanded
- Constant returns to size - increase in output is equal to the proportional increase in input use - LAC is horizontal when firm is expanded

## Returns to Size

## What can we say about the four firms in this graph?

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Size 1 would lose Long-run Adjustment of Firm Size money at price $P$

## GPS and GIS for Production

$\qquad$

- What is it?
- Global position system
- Geographic information system
- http://winebusiness.com/wbm/?go=getArticle\&datald=30473
- Manufacture GPS Units
$\qquad$
$\qquad$
$\qquad$
- Inputs
- Labor
- Capital
- Output
- GPS Units

## GPS Units Isoquants

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

$\qquad$

## Marginal Rate of Technical Substitution MRTS

- Amount of input B which can be substituted for input $A$ in such a way that output is held constant
- The slope of the isoquant
- MRTS $=\frac{\text { Change in capital }}{\text { Change in labor }}=-\frac{\text { MPP }_{\text {labor }}}{\text { MPP }_{\text {capital }}}$

Why?
$\operatorname{MPP}_{\text {capital }}=\frac{\Delta \text { output }}{\Delta \text { capital }}$ and $\quad \operatorname{MPP}_{\text {Iabor }}=\frac{\Delta \text { ouput }}{\Delta \text { labor }}$

$$
-\frac{\mathrm{MPP}_{\text {labor }}}{\mathrm{MPP}_{\text {capital }}}=-\frac{\frac{\Delta \text { output }}{\Delta \text { labor }}}{\frac{\Delta \text { output }}{\Delta \text { capital }}}=-\frac{\Delta \text { capital }}{\Delta \text { labor }}=\text { MRTS }
$$

- Analogous to consumer indifference curves

$$
\mathrm{MRS}_{\mathrm{B} \text { to } \mathrm{A}}=-\frac{\mathrm{MU}_{\text {good } \mathrm{A}}}{M U_{\text {good } \mathrm{B}}}
$$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Iso-cost - Add Input Prices

Change in budget

Change in wage rate
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Marginal Rate of Substitution in Exchange

- Represents how you can change input usage and not change costs
- The slope of the iso-cost line
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$=\frac{\text { Change in cost of capital }}{\text { Change in cost of labor }}=-\frac{\text { Wage rate }}{\text { Rental rate }}$
- Analogous to consumer budget constraint $\qquad$
- Slope of budget constraint = price ratios

## Why?

- Calculate slope using the two axis intercepts

$$
\begin{aligned}
& \text { slope }=\text { rise } / \text { run }=\Delta \text { capital } / \Delta \text { labor } \\
& =(y \text { intercept }-0) /(0-\mathrm{x} \text { intercept }) \\
& =\frac{\left(\frac{\text { Budget }}{\text { Rental rate }}-0\right)}{\left(0-\frac{\text { Budget }}{\text { wage rate }}\right)}=-\frac{\text { wage rate }}{\text { rental rate }}
\end{aligned}
$$

## Least Cost Input Combinations

$\qquad$

- Problem one - for a given output, what is the least cost combinations of inputs?
- Problem two - for a given cost, what is the least cost combination of inputs and associated maximum output level?
- Decision Rule
- The least cost combination of two inputs (labor and capital in our example) occurs where the slope of the iso-cost line is tangent to the isoquant.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
- Analogous to consumer equilibrium

## Least Cost Combination

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Least Cost Combination

## Least Cost Combination

## Least Cost Combination

## Least Cost Combination

## Least Cost Combination

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Least Cost Combination

## Least Cost Combination

## Least Cost - Both Problems

- Least cost combination given by tangent point of isoquant and iso-cost = slopes equal (see earlier slides)

$$
-\frac{\text { MPP }_{\text {labor }}}{\text { MPP }_{\text {capial }}}=-\frac{\text { Wage rate }}{\text { Rental rate }}
$$

- Therefore,

$$
\frac{{ }^{\text {re, }} \text { MPP }_{\text {labor }}}{\text { Wage rate }}=\frac{\text { MPP capital }}{\text { Rental rate }}
$$

- Analogous to consumer equilibrium point
- MU good 1 / price good $1=$ MU good 2 / price good 2

## Least Cost Combination

## Labor Wages Increase

## Thought Question

$\qquad$

- What is the relationship between the optimal answer for the following two problems?
- Problem one - for a given output, what is the least cost combinations of inputs?
- Problem two - for a given cost, what is the least cost combination and output level?

## Review - Least Cost and Firm Size

Currently at output $=10$ and $\mathrm{C}_{1}$ and $\mathrm{L}_{1}$ $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
Size

## Least Cost and Firm Size

## Least Cost and Firm Size

## Can the Firm Do Better?

$\qquad$

- Currently manufacture 150 GPS units for $\qquad$ agriculture using
-3 units of capital $\qquad$
- 8 units of labor
- Cost of \$3500
$\qquad$
- Sell agriculture GPS units at a wholesale price of \$50 / unit
- Can sell car GPS units wholesale for $\$ 40$ / unit $\qquad$
$\qquad$

## Production Possibility Curves

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Marginal Rate of Product Transformation

- Represents the rate at which one product (GPS Cars) must increase (decrease) for a decrease (increase) in the other product (GPS Ag.)
- MRPT $=\frac{\text { Change in GPS Cars }}{\text { Change in GPS Ag. }}$
- MRPT = the slope of production possibility curve

## MRPT Example

$\qquad$

What is MRPT between points $A$ to $B$ ?
Point $\mathrm{A}=100$ GPS Ag. \& 113 GPS Cars

## Iso-Revenue Lines

- Represents the combinations of the two products (goods) that provide the same revenue
- Total Revenue $=$ price good $A \times$ quantity good $A+$ price good $B \times$ quantity good $B$
- Total Revenue $=\$ 40 \times$ GPS Cars $+\$ 50 \times$ GPS Ag
- Gives the rate the market is willing to exchange one product (good) for another

## Slope Iso-Revenue Lines

$\qquad$

- Slope $=\frac{\text { Change in revenue good } A}{\text { Change in revenue good } B}$

$$
=-\frac{\text { Price of good B }}{\text { Price of good } A}=-\frac{\text { Price of GPS Ag }}{\text { Price of GPS Car }}
$$

- Analogous to budget constraint consumer (\& isocost)
-     - price good A / price good B
- Why? See homework!

## Summary \#1 - Know

- Production function and related curves
-TPP, APP, and MPP
- Cost Curves
-FC, AVC, VC, AVC, TC, ATC, and MC
- Revenue Curves
- TR, AR, and MR
- Input Side - MVP
- Profit maximizing points
- MR $=$ MC, MVP $=$ MIC
- Short-run supply curve
-MC above AVC

## Summary \#2

- Concepts of iso-cost line and isoquants
- Marginal rate of technical substitution (MRTS)
- Least cost combination of inputs for a specific output level
- Effects of change in input price
- Level of output and combination of inputs for a specific budget
- Key decision rule ...seek point where MRTS = ratio of input prices, or where MPP per dollar spent on inputs are equal.

## Summary \#3

- Concepts of iso-revenue line and the production possibilities frontier
- Marginal rate of product transformation (MRPT)
- Concept of profit maximizing combination of products
- Effects of change in product price
- Key decision rule - maximize profits where MRPT equals the ratio of the product prices
