**LORA** Overview

- ✓ Level of Repair Analysis (LORA)
  - Analytical Methodology used to establish the maintenance policy at which an item will be replaced, repaired, or discarded
  - Determines cost effective maintenance concept of a system
  - Recommendations based upon economic and noneconomic factors

### **LORA** Overview

✓ Supports development of maintenance policy

### ✓ Utilizes Multiple Data Sources

- LPD
- FMECA/FTA
- MTA

### ✓ Results

- Optimized balance between Operational Availability and Maintenance Cost
- Drives the Product Support Strategy and Product Support Package

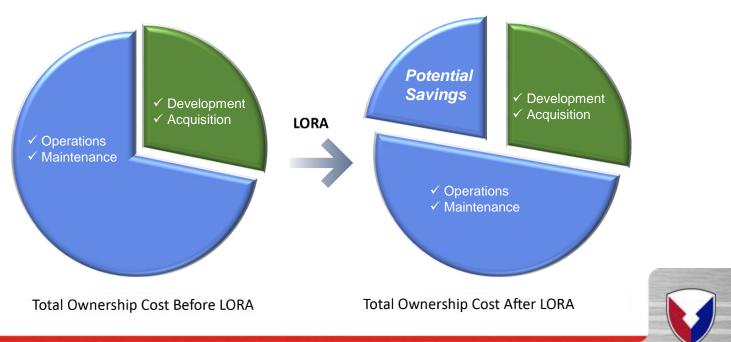

LORA continually influences and supports decisions.

## Why Conduct a LORA

- ✓ Operations and Maintenance typically accounts for most of Total Ownership Cost (TOC)
- ✓LORA optimizes life cycle logistics support cost
  - Logistics Footprint
  - Design Influence and Optimization
- Savings from a properly conducted LORA can be in the millions of dollars

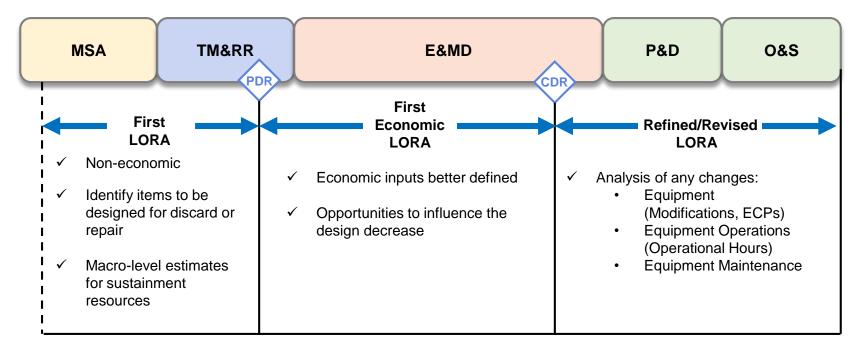

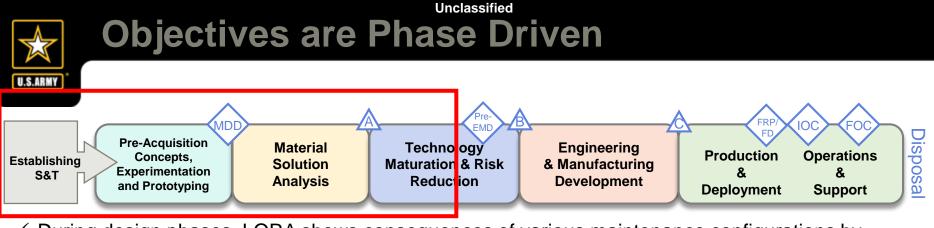

## Frequency of a LORA

"Starting the LORA process early in a system's development, and continuous evaluation throughout its life cycle, can ensure a LORA influences the systems' design and the maintenance planning... After the system has been fielded, follow-on analyses should be scheduled that include the use of field feedback data. The extent and detail of LORA should be tailored to the life cycle phase of the program."

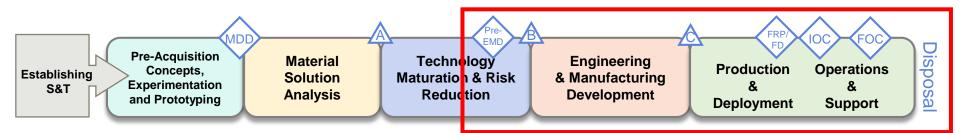

- During design phases, LORA shows consequences of various maintenance configurations by evaluating the non-economic factors and the high-level cost of logistics support for each alternative
- ✓ LORA measures the cost of failure frequency and failure duration (downtime), and thus influences the design for more cost-effective alternatives
- ✓ Potential problems with operational availability, life cycle maintenance costs, etc., are identified and avoided

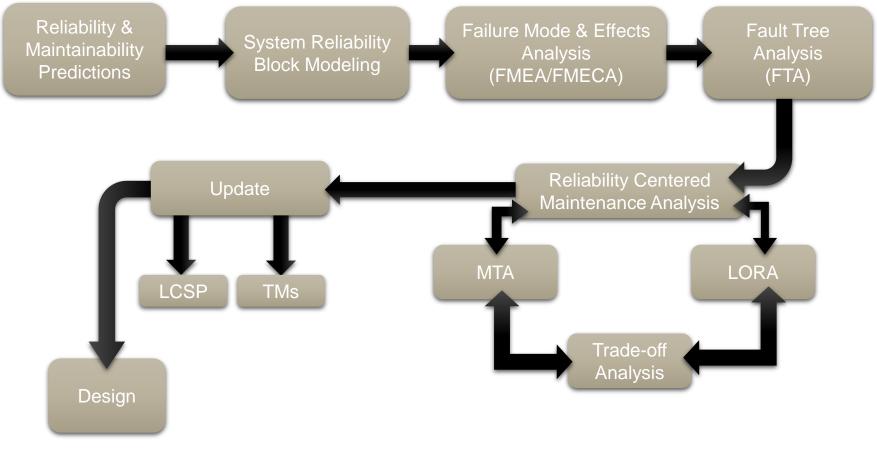

✓ After design is approved, LORA minimizes the requirement for spares and support resources

- ✓ The approved maintenance plan anticipates future equipment repair workloads, and ensures the availability of proper parts, trained technicians, support equipment, tools, and facilities
- ✓ A properly constructed and funded maintenance structure minimizes downtime durations affordably

#### **PSA** and LORA

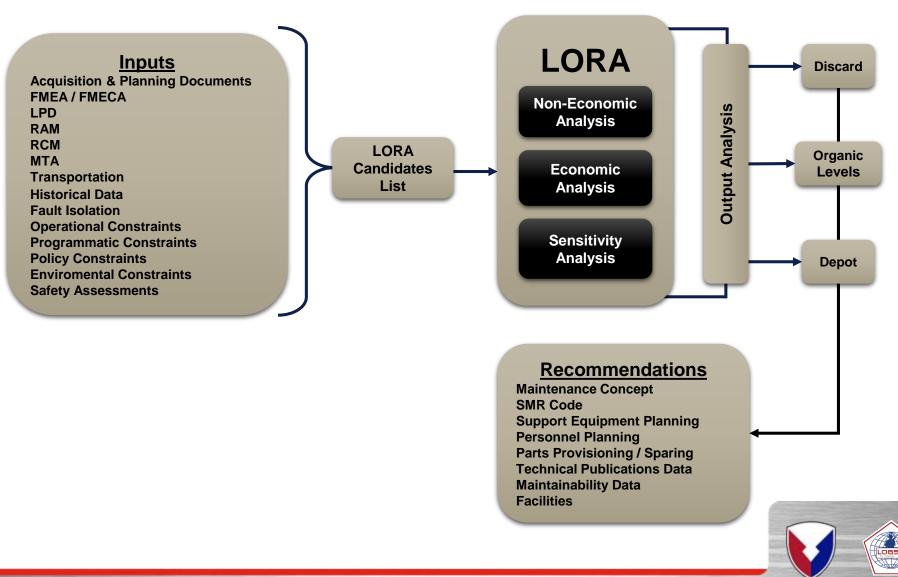

Adapted from SAE GEIA-STD-0007-B
