1. Introduction

Grundfos pumping stations are prefabricated pumping stations designed for collection and pumping of drainage water, rainwater or wastewater.

The pump pit is made of polyethylene (PE-HD) and comes with outlet pipe and valves fitted. The pump(s) may be supplied separately.

The pipes are made of polyethylene (PE) or stainless steel (AISI 304 or AISI 316).

Unless another cover solution is selected, D500 to D1200 pits are supplied with a polyethylene cover (PE-HD), locked with a special M10 bolt. The D1700 pit has an aluminium cover, locked with a padlock. As an option, the D1700 pit can be modified with a reduced top to use the D1200 PE cover.

The pump type will depend on the type of pumped liquid.

The drainage water, rainwater or wastewater is led into the pit. When the liquid in the pit reaches the start level, the pump(s) will start and pump the liquid further in the system to a sewage treatment plant or sewer.

Features and benefits

The complete system

Now, all the components of your pumping stations can be Grundfos quality. To complement our range of high-quality pumps and pumping equipment, we have developed a complete pumping station range featuring all the qualities you need:

- sturdy materials
- well-designed polyethylene pits
- all necessary accessories such as pipes and valves, as well as reliable controllers.

You get a complete pumping station ready to be installed. Getting everything from one supplier, you can be certain that all components meet the most stringent quality requirements and fit perfectly together.

Once the pumping station is installed, you will find that maintenance is reduced to an absolute minimum.

The combination of sturdy materials and convenient access to valves and pumps not only makes service and maintenance easier, it also makes them much less frequent.

Great advantages

- **Corrosion-free materials**
Grundfos pumping stations are made of corrosion-free materials throughout. This uncompromising choice of materials and the unique design make the pumping stations remarkably service-friendly and reliable.
- **Modular flexibility**
The prefabricated pumping stations consist of four main elements:
 - one or two of our highly efficient and reliable pumps
 - a pit in the size to suit your requirements
 - all pipes and valves
 - controllers to ensure operational efficiency and safety.
- **Many sizes available**
The pits are available various sizes, comprising five standard diameters and up to four standard depths. The standard range is regularly updated with more variants. For the latest updates, see www.grundfos.com/pumping_stations.
- **Installation- and service-friendly design**
The pit has an extended sump to secure the pit against uplift when installed in areas with high groundwater level (DS/EN 1997-1 DK NA:2015, safety against uplift).
At the same time, the extended cone-shaped sump improves the self-cleaning effect and thereby limits sludge and odour problems. All components in the pumping station can be reached from the top. In pit sizes below D1200, the auto coupling is secured in the bottom position without any use of screws. It is possible to remove the coupling together with the pipework without entering the pit.

Component overview

The components of the pumping station are selected according to Grundfos's principles of high reliability, long life and great consideration for the environment during production, operation and disposal.

TM04 4617 1809

Grundfos offers a number of standard pits, but we recommend that you size and configure a pumping station based on your specific needs using the "Grundfos pumping station creator" to ensure the best solution. See [Selection tool](#) on page 8 or follow the link below.

Grundfos pumping station creator

<https://app.grundfos.com/pust/frontpage>

Pumped liquids

- Drainage water
- rainwater (surface water)
- wastewater.

Liquid temperature

The liquid temperature that can be handled depends on the pump selected. See the installation and operating instructions for the pump. In general, the maximum liquid temperature is 40 °C. If your liquid has a higher temperature, contact your local Grundfos company.

For certain pump types, 60 °C are permissible for short periods. At 60 °C, the pit material begins to soften.

Acids and alkalis

The pump pit is resistant to strong acids and alkalis as well as solvents.

The pumps are supplied with the pump pit and are normally resistant to pH values between 4 and 10. In case of doubt, contact your local Grundfos company.

Viscosity

Very thick wastewater must not be led into the pit. See also the installation and operating instructions for the pump.

Density

Maximum 1100 kg/m³.

3. Selection of products

When ordering a Grundfos pumping station, you need to take the following six aspects into consideration:

1. Pump
2. Installation type of the pump
3. Diameter and depth of pit
4. Level control system
5. Pump controller
6. Accessories.

1. Pump

See the data booklet for the selected pump or Grundfos Product Center at www.grundfos.com and [Type key, PS.R.05 - PS.R.17](#) on page 6. For further information about Grundfos Product Center, see page 27.

2. Installation type of the pump

See [Type key, PS.R.05 - PS.R.17](#) on page 6.

The pump(s) can be installed in three ways:

- on a standard auto-coupling system on the bottom of the pit
- on a hookup auto-coupling system at the top of the pit
- free-standing.

3. Diameter and depth of pit

The pump pit is available in various sizes. See [Dimensions and weights](#) on page 26 for dimensions and for calculation of needed volume.

Depth [mm]	D500	D800	D1000, one pump	D1000, two pumps	D1200, one pump	D1200, two pumps

5670	•		•
5840	•		•
6000	•		•

4. Level control system

See [Pump controllers](#) on page 16 or Grundfos Product Center.

5. Pump controller

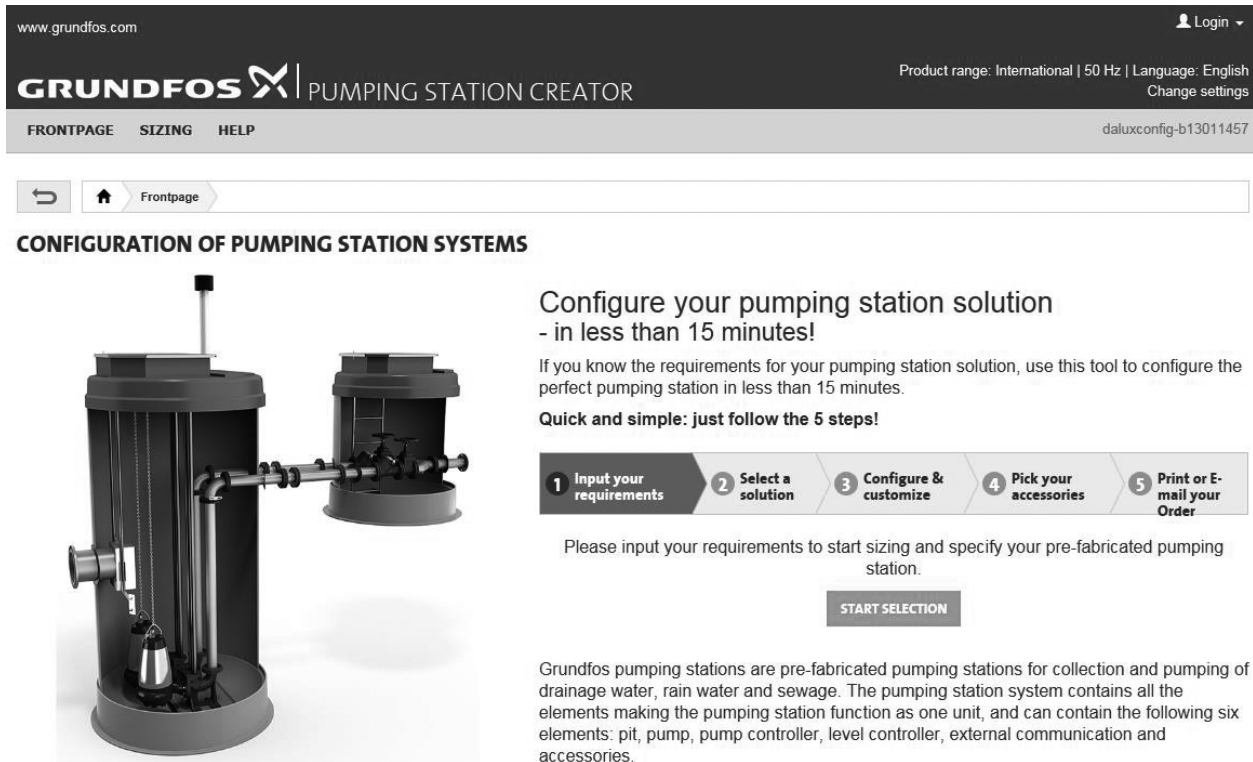

See [Pump controllers](#) on page 16 or Grundfos Product Center.

6. Accessories

Depending on the installation type, accessories may be required. For selection of the correct accessories, see [Accessories](#) on page 16.

Selection tool

You can find the selection tool PUMPING STATION CREATOR in Grundfos Product Center at www.grundfos.com or follow the link in the QR code below.

CONFIGURATION OF PUMPING STATION SYSTEMS

Configure your pumping station solution - in less than 15 minutes!

If you know the requirements for your pumping station solution, use this tool to configure the perfect pumping station in less than 15 minutes.

Quick and simple: just follow the 5 steps!

- 1 Input your requirements
- 2 Select a solution
- 3 Configure & customize
- 4 Pick your accessories
- 5 Print or E-mail your Order

Please input your requirements to start sizing and specify your pre-fabricated pumping station.

START SELECTION

Grundfos pumping stations are pre-fabricated pumping stations for collection and pumping of drainage water, rain water and sewage. The pumping station system contains all the elements making the pumping station function as one unit, and can contain the following six elements: pit, pump, pump controller, level controller, external communication and accessories.

Fig. 5 Selection tool in Grundfos Product Center

1. Input (enter) your requirements

Here you enter information about flow rate, head, number of pumps and operating mode. This will ensure that we offer the right pump for the task. Please also enter information about the depth of the lowest inlet to the pumping station to get some good suggestions for solutions. The selection tool offers a list of pumps from which you can select the pump that best fits your requirements.

2. Select a solution

Here a number of possible solutions are presented, and you can select the one that fits your requirements.

3. Configure & customize

Here you can make the detailed configuration of the selected solution. Drawings of the selected solution are presented.

4. Pick your accessories

Here you can select accessories for your customised solution.

5. Print or e-mail your order

Here the final solution is presented as a CAD drawing that can be downloaded. Specification reports for the customised solution can be generated, printed and sent to Grundfos. This is the information Grundfos needs to give you a quotation and lead time for delivery.

Pumping station variants

If you did not find the required pumping station in our standard range, please contact your local Grundfos company. We have other ranges of prefabricated pumping stations, but they vary from region to region. For large prefabricated pumping stations, please see Grundfos Product Center or contact your local Grundfos company for information about range and designs available in your region. We offer a huge range of large prefabricated pumping stations to fit our range of large pumps. This range covers versions up to 3 metres in diameter and 12 metres in depth in both glass-fibre-reinforced polyester, polyethylene and polypropylene.

CE mark

Grundfos pumping stations are CE-marked. Depending on the pump and controller selected, they are marked in accordance with one or several of the following directives:

- EMC Directive
- Low Voltage Directive
- ATEX Directive
- Machinery Directive.

The declaration of conformity and declaration of performance can be seen in the installation and operating instructions of the products in question.

Baffle plate

The baffle plate slows the incoming flow of liquid and prevents splattering inside the pit.

The baffle plate is available for D1700 pits for all pipe sizes.

TM06 8863 1317

Fig. 27 Baffle plate

Screen basket

The screen basket holds back solid materials, such as stones and branches in the incoming flow of liquid.

The screen basket is available for D1700 pits as standard for all pipe sizes.

TM06 8852 1317

Fig. 28 Screen basket

5. Pump controllers

IO 113

IO 113 is a protection module for Grundfos wastewater pumps.

The module has inputs for digital and analog sensors and can stop the pump if a sensor indicates a pump fault.

The module is connected to the Dedicated Controls system and allows advanced monitoring functions, such as:

- motor temperature
- moisture in the motor
- water in oil or water in air
- insulation resistance.

SM 113

SM 113 is used for collection and transfer of sensor data. The module works together with IO 113 through power line communication using the Grundfos GENIbus protocol.

The module can collect data from these devices:

- 3 current sensors, 4-20 mA
- 3 Pt1000 thermal sensors
- 1 thermistor circuit (3 sensors in series)
- 1 digital input.

Level controllers

Grundfos offers dedicated pump controllers for monitoring liquid levels in the wastewater collecting tanks to ensure correct operation and protection of the pumps.

Grundfos pump controllers that are ideal to be connected to Grundfos wastewater pumps include:

- Grundfos Dedicated Controls (DC)
- Grundfos LC controllers

Grundfos DC Controllers

Fig. 29 Grundfos Dedicated Controls control cabinet

Grundfos Dedicated Controls (DC) is a control system designed for installation in municipal wastewater transportation, commercial buildings or network pumping stations with up to six wastewater pumps and an optional mixer or a flush valve.

Advanced control and data communication are also possible with the Grundfos Dedicated Controls system. The control cabinets are delivered with a built-in main switch and thermal magnetic circuit breaker.

Features and benefits:

- Advanced Flow Calculation
- Automatic energy optimisation
- Easy installation and configuration
- Configuration wizard
- Electrical overview
- Advanced data communication
- Advanced alarm and warning priority
- Supports several languages
- Daily emptying
- Mixer control or flush valve
- User-defined functions
- Anti-blocking
- Start level variation
- Advanced pump alternation with pump groups
- SMS scheduling
- Communication to SCADA, BMS, GRM or cell phone.

Dedicated Controls is ordered either with or without a built-in communication interface module (CIM).

The communication module enables the possibility for fieldbus protocol (e.g. PROFIBUS DP, Modbus RTU and PROFINET IO/Modbus TCP) and the communication line.

For further information about Grundfos Dedicated Controls, please see Grundfos Product Center:

- Grundfos Dedicated Controls, brochure <http://net.grundfos.com/qr/i/96925597>
- Grundfos iSolutions, brochure <http://net.grundfos.com/qr/i/99249771>
- Grundfos Controls Guide, product guide <http://net.grundfos.com/qr/i/97954965>

Additional features, CUE or VFD

The CUE/VFD (optional), which is either a Grundfos variable frequency drive or a general variable frequency drive, offers better pump protection and a more steady flow through the pipe system.

In addition, Grundfos CUE, VFD offers these features and benefits:

- anti-blocking
- automatic energy optimisation
- specific-energy test
- output frequency
- monitoring of:
 - voltage*
 - current*
 - phase sequence*
 - power*
 - energy*
 - torque*
- reverse start**
- run flushing
- stop flushing
- PID control.

* These functions are only available with a Grundfos CUE.

** We do not recommend reversing at full speed at any time. When reduced reverse operation settings are set, make sure constant torque is enabled in Variable Frequency Drive (VFD) (i.e. Grundfos CUE, Siemens Simatic, ABB, Schneider Electric etc.) to have maximum torque available when reversing.

LC range

Grundfos LC level controllers are available in two variants:

LC 231 - a compact solution complete with certified motor protection

LC 241 - a cabinet solution offering modularity and customization

Designed for installations with one or two pumps, the Grundfos LC level controller is ideal for emptying and filling related to small wastewater transport, commercial buildings and tank-filling applications.

The controller can support up to five control levels for both analogue level transmitter or float switch operation.

For emptying applications, if the tank or pit is completely filled, the controller will run all pumps to empty.

The controller is equipped with Grundfos configurable input/output terminals, giving full flexibility for all applications. Daily control, supervision and commissioning is straightforward with the intuitive and easy-to-use user interface. This saves you valuable time when getting started, and in your daily interaction with pumps and the controller. The controller integrates seamlessly into the Grundfos range of communication modules, ensuring an easy fit into any supervisory system such as SCADA or Grundfos CLOUD Solution.

CU 100

The CU 100 control box is designed for the starting, operation and protection of small wastewater pumps.

The control box is available in several variants which can be used for the following pumps:

- single-phase pumps (up to and including 9 A)
- three-phase pumps (up to and including 5 A).

The control box is also suitable for the following functions:

- start/stop by means of a float switch
- manual start/stop.

During manual operation, the pump is started and stopped by means of the on/off switch.

During automatic operation, the float switch will start and stop the pump.

For further information, see the installation and operating instructions for CU 100 in Grundfos Product Center at www.grundfos.com.

Fig. 32 CU 100

TM02 6459 0703

CUE

Grundfos CUE is a complete range of external frequency converters designed for speed control of a wide range of Grundfos pumps.

TM06 9423 2317

Fig. 33 CUE

CUE has a built-in PI controller and offers the same functionality and user-interface as Grundfos S-pumps. CUE solutions can thus be seen as an extension to the S-pump range.

CUE offers the following benefits:

- speed control of pumps up to 250 kW (also pumps installed in potentially explosive environments)
- 2 alarm outputs (C, NO, NC)
- 1 sensor (4-20 mA)
- 2 Pt100 or Pt1000 sensors.

AUTO_{ADAPT} pumps

Grundfos CIU

The Grundfos CIU unit is used as a communication interface between a Grundfos product and a main network. The CIU unit is used as an interface for the following functions:

- configuration of pump parameters required for water level control
- online monitoring of pit and pump values
- manual water level control (forced start/stop)
- obtaining of measured and logged data that are valuable for pump service and pit optimisation.

The CIU unit is designed for use together with Grundfos AUTO_{ADAPT} pumps. Communication can be established with Grundfos GO or by using the main network interface of the CIU unit.

Available CIU units:

- CIU 152 PROFIBUS DP
- CIU 902 (without CIM module)
- CIU 202 Modbus
- CIU 252 GSM, GPRS
- CIU 272 GRM (Grundfos Remote Management).

The CIU unit incorporates one or two modules:

- multipurpose I/O module with I/O functionality, IR communication interface and power line communication
- CIM module (optional).

For further information about the CIM module fitted, see the installation and operating instructions for the CIM module.

If a CIM module is fitted in the CIU unit, the sensors connected to the digital input of the I/O module can be remotely monitored from a centrally located SCADA system.

Grundfos GO

Grundfos GO is designed for wireless IR communication with Grundfos products. Grundfos GO can communicate with the AUTO_{ADAPT} pumps via a CIU unit.

Grundfos GO is to be regarded as an ordinary service and measuring tool and is therefore designed to withstand wear and stress from everyday use.

ADC

The ADC fuse box is designed for the protection of the power supply for small wastewater pumps.

TM06 9424 2317

Fig. 34 ADC

The fuse box enables communication with the following devices:

- Grundfos Remote Management, GRM
- Grundfos GO
- SCADA.

The fuse box can be used with the following systems and devices:

- one-pump installation with or without CIU⁽¹⁾
- two-pump installation with or without CIU⁽¹⁾
- CIU units:
 - CIU 202 Modbus RTU⁽²⁾
 - CIU 272 GRM⁽²⁾
 - CIU 902⁽²⁾
 - CIU 252 GSM complete⁽²⁾
- optional service socket 230 V⁽³⁾/50 Hz⁽²⁾
- optional socket for PC Tool link box⁽²⁾
- optional fault indicator light mounted on top⁽²⁾
- optional audio alarm, 100 dB⁽²⁾.

⁽¹⁾ With CIU unit, a CIM module is needed.

⁽²⁾ Must be ordered with the control box.

⁽³⁾ The modules come as two parts and must be assembled.

For further information, see the installation and operating instructions for ADC in Grundfos Product Center at www.grundfos.com.

7. Installation

Installation

Local regulations and legal requirements must always be followed. For further information, see the installation and operating instructions for the pumping station.

Installation of pump

Some versions come without the pump installed. For installation and startup of the pump, see the installation and operating instructions for the pump.

Note: The pump must be lowered carefully into the pit in order to avoid damage to pump and pit.

Pipework with flange connections

If the pit is to be installed at temperatures below 0 °C, slacken all flange bolts and retighten them when the pumping station has been installed. In this way, stress in the pipes is prevented.

Fitting the chain

In the case of pumps on auto coupling, we recommend that you fit the chain in the foremost lifting eye of the lifting bracket. When lifting the pump make sure to use a lifting device that is approved for the weight of the pump. Make sure to keep body parts away from a lifted pump.

Fig. 35 Chain fitted to pump

TM02 9341 2514

Installation of level controller

See the installation and operating instructions of the controller.

Location of the inlet

The pit inlet must not be located within the area shown in fig. 36 as the inflow of liquid will disturb the function of the float switches.

Fig. 36 Location of inlet, D500-D1200

TM02 8961 1204

Fig. 37 Location of inlet, D1700

TM05 3261 1012

Startup

See the installation and operating instructions of the pump and the controller, respectively.

Note: The controller must not be installed in the pit.

Maintenance

See the installation and operating instructions of the pump and the controller, respectively.

It is important that the pit cover is properly secured so that unauthorised persons cannot remove it.

8. Technical data

Starting frequency

In a pumping station, the total water volume consists of the volume below the lowest pump stop level and the effective volume above this level. The effective volume varies with pump usage and the incoming flow rate.

The starting frequency of the pumps depends on the effective volume available and the incoming flow rate.

The starting frequency Z is a function of the ratio between Q_{in}/Q and V_h .

Q_{in} = incoming flow rate [l/s]

Q = pump performance [l/s]

V_h = accumulated (effective) volume between start and stop [m^3].

Note: If the maximum incoming flow rate is equal to the pump performance, the pump will be running permanently.

Z_{max} : maximum number of starts per hour.

$$Z_{max} = \frac{Q \times 3.6}{4 \times V_h}$$

V_h : necessary, minimum accumulated volume between start and stop.

$$V_h = \frac{Q \times 3.6}{4 \times Z_{max}}$$

Sump volume

In installations where the expected maximum incoming flow rate, Q_{in} , is less than 60 % of the selected pump performance, the accumulated sump volume must be calculated in such a way that there will be at least two pump starts a day in order to prevent sedimentation in the sump.

Total volume: The volume of the complete tank.

Emergency volume: The volume from the bottom of the pit to the lowest inlet.

Sump volume: The volume from the bottom of the pit to the start level.

Effective volume: The volume pumped in every pump cycle - the volume between the start and stop level.

The following drawings show values of empty pits without pump, pipe, etc.

9. Grundfos Product Center

Online search and sizing tool to help you make the right choice.

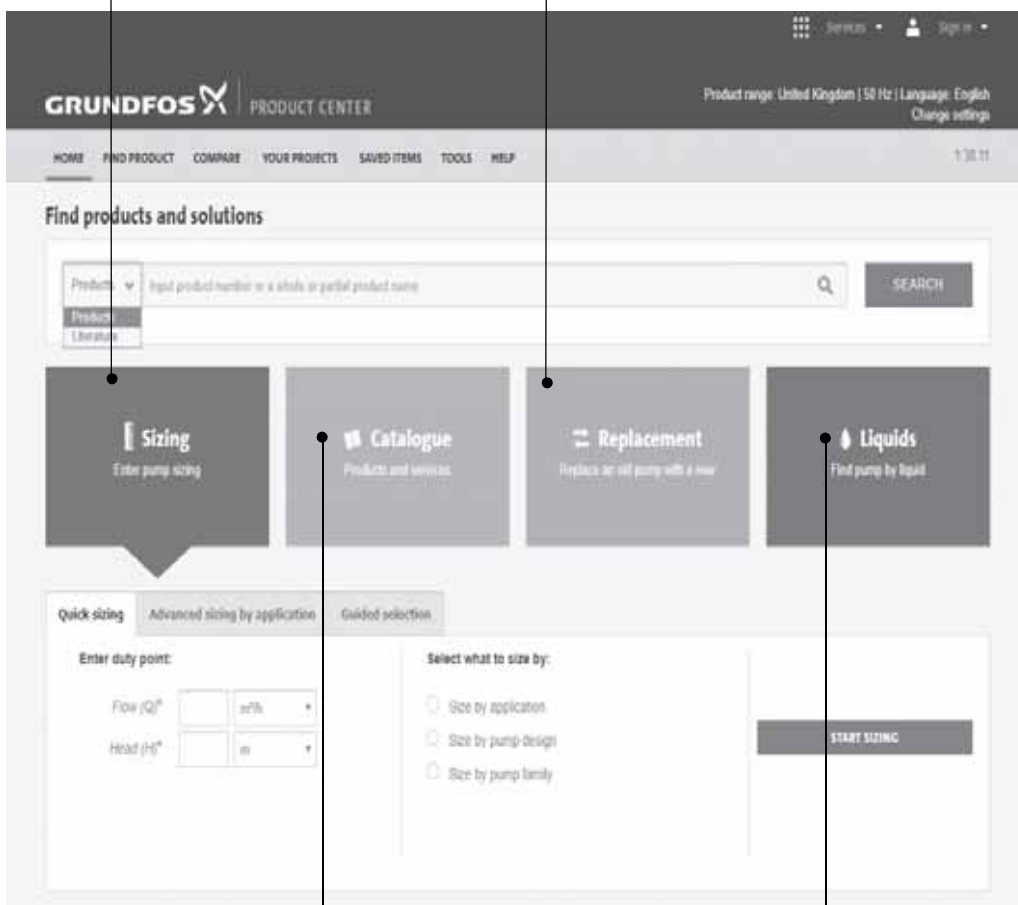

<http://product-selection.grundfos.com>

"SIZING" enables you to size a pump based on entered data and selection choices.

"REPLACEMENT" enables you to find a replacement product. Search results will include information on the following:

- the lowest purchase price
- the lowest energy consumption
- the lowest total life cycle cost.

"CATALOGUE" gives you access to the Grundfos product catalogue.

"LIQUIDS" enables you to find pumps designed for aggressive, flammable or other special liquids.

All the information you need in one place

Performance curves, technical specifications, pictures, dimensional drawings, motor curves, wiring diagrams, spare parts, service kits, 3D drawings, documents, system parts. The Product Center displays any recent and saved items - including complete projects - right on the main page.

Downloads

On the product pages, you can download installation and operating instructions, data booklets, service instructions, etc. in PDF format.

Subject to alterations.
