

Recommended Construction Guidelines For Cold In-place Recycling (CIR) Using Bituminous Recycling Agents CR101

Revised 4/7/2016

NOTICE

It is not intended or recommended that these guidelines be used verbatim within a specification. Owner Agencies should use them to help establish their particular project specification. Owner Agencies should understand that all geographical areas and pavement rehabilitation/preservation projects are unique and the availability of materials and equipment may vary as well. ARRA assumes no liability for utilization of these guidelines by any individual or entity. Contact ARRA for answers to questions and for a list of ARRA member Contractors and Suppliers.

**Asphalt Recycling & Reclaiming Association
#3 Church Circle, PMB 250
Annapolis, MD 21401
(410) 267-0023
www.ARRA.org**

1. General

Cold In-place Recycling (CIR) shall consist of milling and pulverizing (reclaiming) a portion of the existing asphalt pavement to the length, depth and width as shown on the plans, sizing the Reclaimed Asphalt Pavement (RAP) and blending with a bituminous recycling agent (either foamed asphalt, also known as expanded asphalt, or emulsified asphalt), water and other additives (cement, lime, corrective aggregate) as necessary and as required by the mix design, to produce a recycled asphalt layer. This material shall then be placed and compacted in accordance with the plans and specifications.

2. Treatment Thickness

The depth of CIR shall be _____ inches (mm) or as indicated on the plans or specifications.

User Note: CIR will not compact to the same milling depth. Owner Agencies have specified CIR treatment thickness as either a milled depth or as a compacted CIR thickness. Specifying a milled depth is preferable as specifying a compacted thickness requires the Contractor to estimate a milling depth that will be less than the compacted thickness to account for the increased volume. CIR treatment thicknesses have varied from 2-5 inches (50-125 mm) with 3-4 inches (75-100 mm) being the most common. Treatment thicknesses should be dependent on structural capacity requirements and project-specific criteria such as original asphalt thickness and expected design life.

3. Preconstruction Personnel Training

Personnel involved with the construction of CIR from both the Contractor and Owner Agency shall have successfully completed Preconstruction Personnel Training (PPT) to ensure that proper procedures are followed to construct a high quality CIR pavement. The PPT shall be conducted at a location convenient for both the Contractor and the Owner Agency. The PPT shall be completed not more than ___ days, not including Saturdays, Sundays or holidays, prior to the start of CIR operations. The training shall be held during normal working hours. In lieu of this training, proof may be provided showing successful experience has been obtained by the individuals performing the work for the materials and construction techniques to be used in the CIR construction.

The PPT trainer shall be provided by the _____ (*Contractor or Owner Agency*). The PPT trainer shall be experienced in construction methods, materials and test methods associated with construction of CIR projects. The Contractor and Owner Agency shall mutually agree to the course instructor, course content and training site.

User Note: Typically, PPT is held less than 5 days before the start of the CIR. PPT should be close enough to the start of construction so that it is fresh but also allow some time to address any issues that may be raised during the training.

4. Materials

CIR shall consist of a homogeneous blend of RAP, bituminous recycling agent (either foamed asphalt or emulsified asphalt), water and other additives, if required. The actual materials used and their respective usage rates are dependent on the mix design and project requirements.

4.1 Reclaimed Asphalt Pavement

Reclaimed Asphalt Pavement (RAP) shall consist of asphalt coated material only. The RAP shall be free of contamination of dirt, base, concrete or other deleterious materials such as silt and clay. The RAP shall be reclaimed from the roadway and sized to meet contract requirements. The gradation of the RAP shall have 100% passing the 1.25 inch (31.5 mm) sieve.

RAP from an external location shall be free from dirt, base, concrete or other deleterious materials such as silt and clay. Rubberized crack filler, pavement markers, loop wires, thermoplastic markers, paving fabric and other similar materials shall be removed as observed. Residual materials that cannot be completely removed from the processed RAP may be incorporated into the recycled mix if the Contractor can demonstrate that those added materials will not adversely affect performance. Any such materials retained in the mix shall be appropriately sized and blended so as not to adversely affect the appearance or strength of the recycled pavement. External RAP shall meet the requirements of Table 1 and be included in the mix design.

TABLE 1 – ADDITIONAL CRUSHED RAP		
Tests	Method	Limit
Deleterious Materials: Clay Lumps and Friable Particles in Aggregate, % max	AASHTO T 112 ASTM C142	Maximum of 0.2
Gradation*	AASHTO T 27 ASTM C136	100% passing the 1.25 inch (31.5 mm) sieve

*Gradation only required if the RAP is added after the milling, crushing and sizing unit.

4.2 Bituminous Recycling Agent

Bituminous recycling agent shall consist of either asphalt binder used to produce foamed asphalt or emulsified asphalt. Unless indicated elsewhere within the plans, project specifications, or an Owner Agency supplied mix design, the Contractor shall select the type and grade of recycling agent used.

4.2.1 Asphalt Binder for Foamed Asphalt

Asphalt binder used for foamed asphalt shall be selected to meet local temperature standards and specifications and to ensure that optimum foaming characteristics are met in the field. Polymer modified asphalt binders shall not be used. The asphalt binder shall be of sufficient temperature to meet the minimum expansion and half-life criteria but not be heated above 375 °F (190 °C). Asphalt binder provided to the job shall have no additives or properties which will inhibit the ability to produce asphalt foam with a minimum expansion ratio of ____, and a half-life of not less than ____ seconds. The application rate shall be determined by the mix design.

User Note: The expansion ratio is defined as the volume of foamed asphalt to residual unfoamed asphalt. The half-life is defined as the time for the foamed asphalt to lose half of its expanded volume. Typically, the asphalt binder must exceed 320 °F (160 °C) to achieve optimum foaming characteristics; however, this temperature may vary depending on the type of asphalt binder used. Typical expansion ratios should be a minimum of 8 and the half-life should be a minimum of 6 seconds.

4.2.2 Emulsified Asphalt

Emulsified asphalt shall be selected to meet local standards and specifications and to achieve appropriate mixing with the RAP. Polymer modification may be used. The actual emulsified asphalt type and applicable usage rate shall be determined by the mix design.

User Note: Typical emulsified asphalts used for CIR include CSS-1h, HFE 150 or engineered emulsions.

4.3 Recycling Additives (Optional)

Cement, lime slurry and corrective aggregates may be used as recycling additives to improve CIR mix properties. Cement or lime slurry may be utilized as a catalyst at a small dosage rate to increase mix

cohesion, to aid in curing, to improve early strength gain, and/or to improve moisture susceptibility (stripping) properties of the CIR material. Corrective aggregate may be required to supplement the RAP gradation to meet performance requirements of the mix design. The usage rate of all additives shall be determined by the mix design.

User Note: If other additives such as fly ash or lime kiln dust are desired, caution should be exercised as experience with use of these additives is limited. Cement or lime should not be used with anionic emulsions such as HFE 150.

4.3.1 Cement

Cement, in either dry or slurry form, may be added to the CIR pavement mixture as determined by the mix design. Slurry made from cement shall contain a minimum of 30% dry solids content. Cement shall comply with the latest specifications for Type I or Type II cement (AASHTO M 85, AASHTO M 240 or ASTM C150, ASTM C595). The ratio of residual asphalt in the bituminous recycling agent to dry cement shall be at least 3:1. In addition, the cement shall be limited to a maximum of 1.0 percent by dry weight of RAP. The Contractor shall submit to the Owner Agency the type of process for incorporating cement into the recycling process.

4.3.2 Lime Slurry

Lime slurry produced from high-calcium quicklime or hydrated lime may be added to the CIR pavement mixture as determined by the mix design. Lime slurry shall contain a minimum of 30% dry solids content. The dry solids shall be limited to 1.5 percent by dry weight of RAP. Quicklime or hydrated lime used shall meet requirements of AASHTO M 216 or ASTM C977. The Contractor shall submit to the Owner Agency the type of process for incorporating lime slurry into the recycling process.

4.3.3 Corrective Aggregate

Corrective aggregate may be required to supplement the RAP gradation in order to meet performance requirements of the mix. When required by the mix design, corrective aggregate shall meet the requirements of Table 2.

Tests	Method	Limit
Los Angeles Abrasion Value, % loss	AASHTO T 96 ASTM C131	40 max
Sand Equivalent, %	AASHTO T 176 ASTM D2419	60 minimum
Washed Gradation	AASHTO T 11 & T 27 ASTM C117 & C136	As required

User Note: Corrective aggregate gradation will vary according to size and distribution, depending on the desired effect to the resultant CIR material.

4.4 Water

Water may be added to the RAP at the milling head and/or in the mixing chamber to achieve uniform mixing and to lubricate the mix to facilitate compaction. Water added to the RAP shall be free from deleterious concentrations of acids, alkalis, salts, sugars and other organics, chemical or deleterious

substances. The water shall not cause an adverse effect on either the recycling agent or the recycled pavement mixture. If the water is of questionable quality it shall be tested in accordance with AASHTO T 26 (ASTM C1602) or according to local standards and procedures.

Water used specifically for foaming asphalt shall be filtered so that on evaporation no deposits or residue are left behind that might clog or impede water flow to the foaming nozzles of the recycling unit.

5. Mix Design

If not provided by the Owner Agency, a mix design shall be submitted by the Contractor for approval by the Owner Agency. The mix design shall be performed with representative materials to be encountered during construction of the CIR mix. When the in-place materials change significantly, additional mix designs shall be performed to establish representative mixes for the entire job. Representative samples of the in-place asphalt pavement shall be obtained directly from the project site by sampling in accordance with *ARRA CR201 - Mix Design Guidelines For Cold Recycling Using Emulsified Asphalt Recycling Agent* or *ARRA CR202 - Mix Design Guidelines For Cold Recycling Using Foamed (Expanded) Asphalt Recycling Agent*. The samples shall be delivered to an AASHTO or Owner Agency approved laboratory experienced in cold recycled mix designs where the asphalt pavement samples shall be crushed and mixed with the recycling agent, water and any additives, if required. The mixture shall then be tested in accordance with the mix design guidelines outlined in *ARRA CR201 or ARRA CR201* as applicable. The mix design shall be the baseline measure for the rate of recycling agent application, water and other additives blended with the RAP to construct the recycled pavement mixture. The mix design shall indicate allowable tolerances for the bituminous recycling agent and additives so as to not jeopardize the performance of the mix but allow the Contractor to adjust the mix so that it may be placed and performs successfully.

6. Equipment

The recycling equipment shall be capable of milling the existing roadway, sizing the resulting RAP and mixing the RAP with the recycling agent and any additives stipulated in the mix design. The recycling equipment shall be capable of meeting the specified sizing requirement with either the milling process and/or with additional sizing equipment. The recycling equipment shall be capable of producing a homogeneous recycled pavement mixture by mixing the RAP with the recycling agent, water and any other additives, either in the cold planer (milling machine) housing or in an additional mixing chamber. The equipment used for placement of the recycled pavement mixture shall be capable of placement to the guidelines provided herein and to the lines and grades shown on the plans. The recycling equipment shall consist of the following major components:

6.1 Pavement Cold Planer (Milling Machine)

The pavement cold planer shall be self-propelled. The primary milling equipment shall have a minimum 12.5 feet (3.9 m) cutter capable of removing the existing pavement to the depths shown in the plans or specifications. Milling equipment shall be equipped with depth controls capable of maintaining the cutting depth to within 1/4 inch (6 mm) of the desired depth, and shall have an effective means for controlling cross-slope. The milling operation shall not disturb or damage the underlying material. Use of a heating device to soften the pavement shall not be permitted. A smaller cold planer may be used to mill shoulders, miscellaneous areas and increase the recycle width.

6.2 Crushing and Sizing Equipment

The cold planer and/or any supplemental crushing or sizing equipment shall be capable of producing RAP to the maximum particle size required prior to mixing with recycling agent.

6.3 Mixing and Proportioning Equipment

The properly sized RAP shall be mixed with recycling agent, water and any additives in the mixing chamber. The mixing chamber shall consist of the cold planer cutter housing or a separate pugmill. All systems shall be capable of producing a uniformly mixed, homogeneous, recycled pavement mixture.

If mixing in the cold planer cutter housing, the recycling agent distribution system shall be computer controlled and capable of automatic adjustment for working speed. The recycling agent and any additives shall be introduced at a percentage of weight of RAP calculated volumetrically based on width, depth and unit weight of RAP.

If utilizing a separate pugmill, the RAP shall be weighed on a conveyor belt with a calibrated weigh bridge immediately before entering the mixing chamber. A computer controlled recycling agent distribution system shall be capable of automatically adjusting the recycling agent rate based on RAP weight. Recycling additives shall be introduced at a percentage of weight of RAP from the weigh bridge or calculated volumetrically based on width, depth and unit weight of RAP.

After introduction of recycling agent and any additives, mixing shall continue until the recycling agent is evenly distributed in the recycled pavement.

Recycling agent shall be metered by weight of RAP using a calibrated meter that will accurately measure the amount of recycling agent to within a tolerance of $\pm 2.0\%$ of the specified rate. The recycling agent metering device shall be capable of automatically adjusting the flow of recycling agent to compensate for any variation in the amount of RAP introduced into the mixing apparatus. The mixing apparatus shall have an independent source of water to properly disperse the recycling agent. Calibration of the water meter is not necessary. Automatic digital readings shall be displayed for flow rate of both the RAP and recycling agent in appropriate units of weight and time.

If a foamed asphalt recycling agent is used, the system shall be equipped with a heating system capable of maintaining the temperature of asphalt flow components to maintain the required expansion ratio and half-life. The binder injection system shall contain an independent pumping system and spray bar to regulate the application of foamed asphalt separate from the water used to increase moisture content for compaction. The additive system shall be computer controlled and the rate of addition of water into the hot asphalt binder shall be automatically kept at a constant percent by weight of asphalt binder. An inspection or test nozzle shall be fitted at one end of the spray bar to produce a representative sample of foamed asphalt binder.

User Note: During calibration of the meter, if 3.0% recycling agent is required, based on the allowable tolerance, the meter must deliver the recycling agent between 2.94% to 3.06%. For example, if 8,000 pounds of recycling agent is used, then the tolerance is ± 160 pounds.

The application rate of bituminous recycling agent should be checked during production by evaluating the weight of recycled material against the volume of recycling agent used for a single tanker, as indicated in *CR301 Recommended Quality Control Sampling and Testing Guidelines For Cold Recycling Using Bituminous Recycling Agents*.

6.4 Cement or Lime Slurry Storage and Supply Equipment

Cement or lime slurry storage and supply equipment shall have agitators or similar equipment to keep the cement or lime slurry in suspension when held in the slurry feed tank. Cement or lime slurry shall be kept in suspension during transport using agitator equipment. The meter system controlling application of slurry shall apply the additive within a tolerance of $\pm 10\%$ of the specified rate.

6.5 Spreading of Dry Cement

Dry cement shall be spread on the existing asphalt pavement surface ahead of the cold planer using either a cyclone or screw type calibrated spreader truck built to provide a consistent, accurate and uniform distribution of material. The equipment must apply the additive within a tolerance of $\pm 10\%$ of the specified rate.

6.6 Spreading of Corrective Aggregate

Corrective aggregate shall be spread in consistent and uniform windrows using belly dump trucks or tailgated with end dumps and spread to a uniform thickness with a motor grader or mechanical spreader in front of the cold planer.

6.7 Paving Equipment

The processed recycled mixture shall be spread uniformly across the recycling width utilizing either a self-propelled paver or a screed integral to the recycling equipment. In either case, the screed shall be controlled by electronic grade and cross-slope control. The equipment shall be of sufficient size and power to spread the recycled material in one continuous pass, without segregation, to the lines and grades established by the Owner Agency and according to the plans and specifications. Heating of the screed shall not be permitted. If utilizing a self-propelled paver, material shall either be loaded directly into the paver hopper from the recycling equipment or loaded by a pickup device. If utilizing a pickup device, it shall be capable of removing and transferring the entire windrow of recycled mix in a single pass.

User Note: If a pick up device is used, a track paver with a minimum power of 170 hp should be used.

6.8 Water Truck

A water truck for supplying water to the milling equipment during the CIR operation shall be provided. The water truck system shall be able to supply the mixing chamber, if necessary, so as to provide an independent source of water to properly disperse the recycling agent.

6.9 Compaction Equipment

Compaction of the recycled mix shall be completed using self-propelled rollers complete with properly operating scrapers and water spray systems. The number, weight, and types of rollers shall be as necessary to obtain the required compaction. At a minimum, the following rollers shall be used:

- At least one pneumatic-tired roller with a minimum weight of not less than 22 tons (19.9 metric tons).
- At least one double drum vibratory roller with a minimum weight of not less than 10 tons (9.1 metric tons).

The combined weight of the two required rollers shall be not less than 34 tons (30.9 metric tons). Rollers shall have a width of not less than 65 inches (1.65 m). Tires on pneumatic rollers shall be evenly inflated and matched in size and profile so as to maximize compactive effort.

6.10 Fog Sealing and Sand Spreading Equipment

Fog sealing, if required, shall be applied using a distributor truck, or equivalent, specifically manufactured for the purpose of sealing/spreading asphalt binders or emulsified asphalt at a uniform rate over the full width of a traffic lane in a single application. Sand blotter, if required, shall be spread with a self-propelled screenings or salt spreader equipped with a mechanical device that spreads the sand at a uniform rate over the full width of a traffic lane in a single application.

7. Construction

Prior to the start of construction employees representing both the Contractor and Owner Agency shall submit certification of PPT to ensure the CIR is constructed properly.

Throughout the mixing, placement, and compaction of the recycled mixture adjustments may be made to the recycling agent, water and any additives so as to provide an optimum product. All adjustments shall be recorded by the Contractor and submitted to the Owner Agency.

7.1 Roadway Preparation

Before any recycling work begins the Contractor shall:

- 1) Coordinate the identification and location of all utilities within the CIR operations.
- 2) Remove from the roadway dirt, vegetation, standing water, combustible materials, oils, raised roadway markings, and other objectionable materials by sweeping, blading, or other approved method.
- 3) Adjust identified affected utilities down and fill with material compatible with the CIR mix design or accommodate for utilities prior to recycling as indicated in the plans and specifications.
- 4) Accurately reference the profile and cross-slope as shown on the plans for the finished surface of the recycled pavement material.
- 5) Cold mill along gutters and crosswalks (header cut) as appropriate to prepare for any final overlay. The header cut shall be as indicated on the plans.
- 6) Correct all known areas of soft or yielding subgrade, as indicated on the project plans.

7.2 Weather Limitations

CIR operations shall be performed when the RAP temperature is above 50 °F (10 °C) with overnight ambient temperatures above 35 °F (2 °C). Recycling may be performed during light precipitation so long as the Contractor can demonstrate that performance of the recycled asphalt pavement will not be adversely affected. In the event that the RAP temperature cannot be measured prior to the addition of the recycling agent, the original asphalt pavement surface temperature shall be utilized as the reference temperature.

User Note: Some emulsified asphalt may require a higher operating ambient and/or RAP temperature, such as 60 °F (16 °C) and rising. Depending on the recycling agent, and if additives are used, the minimum temperatures may need to be adjusted.

7.3 Control Strip

During the first day of production the Contractor shall construct a minimum 500 foot (150 m) long control strip to verify that the construction process meets specification requirements. The purpose of the control strip is to:

- A. Demonstrate that the equipment, materials, and processes proposed can produce a recycled pavement material layer that conforms to specification requirements;

- B. Determine the optimal rates for recycling agent, water and any additives recommended for the reclaimed asphalt pavement; and
- C. Determine the sequence and manner of rolling necessary to obtain density requirements.

CIR operations may continue through the first day unless the Contractor's equipment and process fails to meet the requirements for successful completion of CIR operations. Recycling operations shall not continue beyond the first day unless a control strip has been approved by the Owner Agency. Control strips that do not meet specification requirements shall be reworked, recompact, or removed and replaced at the Contractor's expense. On acceptance of the control strip by the Owner Agency, the Contractor shall use the same equipment, materials and construction methods for the remainder of recycling operations unless adjustments made by the Contractor are approved by the Owner Agency. If adjustments are made the Contractor shall produce a new control strip.

In lieu of a control strip the Owner Agency may allow the Contractor to provide proof, based on previous experience with the same equipment, personnel, and materials that the work will conform to specification requirements.

A rolling pattern shall be determined to achieve optimum field density either during the initial control strip or during start up, if the control strip has been waived by the Owner Agency. The Contractor shall determine a sequence and manner of rolling which will define maximum compaction by establishing a rolling versus density chart that shows the progress of densification from initial lay down through maximum obtainable density (target density) at the "break over point" using a properly calibrated nuclear density gauge per ASTM D2950 or other Owner Agency approved method. The Contractor shall determine relative compaction per ASTM D2950, or other Owner Agency approved method, on the quantity within the control strip or during start up. If the relative compaction within the control strip, or at start up, does not meet density requirements, the Contractor shall establish a new rolling pattern to determine the maximum density obtainable (new target density) for the recycled material being produced under current site conditions. The rolling pattern determined shall be strictly followed to ensure compaction is met for the entire CIR surface area. Precautions shall be exercised to ensure that material is not picked up on the drums or tires of the compaction equipment.

User Note: There is not an AASHTO equivalent for ASTM D2950 Density of Bituminous Concrete in Place by Nuclear Methods. Many Owner Agencies have developed their own test methods for determining density of bituminous mixtures using nuclear methods and these procedures are acceptable substitutions. It has not been determined at this time if electromagnetic gauges are suitable for use on cold recycled mixtures; therefore, they are not recommended for use.

7.4 Mixing and Spreading of Additives

Cement or lime slurry may be added directly to the mixing chamber or sprayed over the cutting teeth of the cold planer or milling machine. The Contractor shall provide the Owner Agency with slurry batch logs daily.

Cement or lime slurry storage and supply equipment shall have agitators or similar equipment to keep the cement or lime slurry in suspension when held in the slurry feed tank and during transport.

In the event that dry cement or corrective aggregate is used during CIR construction, the desired material shall be spread on the existing asphalt pavement surface ahead of the milling operation. The distance between the spreader and the milling operation shall be reduced appropriately during windy

days. In no case shall cement be allowed to remain exposed at the end of the workday. Dust control measures shall be employed to minimize fugitive dust. No traffic other than required construction equipment shall be allowed to pass over the spread cement or corrective aggregate until the recycling operation is complete.

7.5 Processing and Placement of Recycled Mix

The existing asphalt pavement shall be milled and pulverized to the length, depth and width as shown on the plans or specifications. The RAP shall be crushed and sized to the maximum particle size specified, blended with the desired rate of recycling agent, water and additives (if required) as dictated by the mix design, or as adjusted in the field so as to produce a homogeneous recycled mixture. The recycled pavement mixture shall exit from the mixing chamber in a manner that prevents particle segregation. The recycled mixture shall be spread using a screed to the design elevations. Care shall be exercised while spreading to avoid segregation, tearing, or scarring of the final compacted surface. Handwork of CIR pavement shall be minimized and care shall be taken to prevent segregation. The paver shall be operated with the wings up or the paver wings regularly emptied to prevent buildup and to minimize segregation. The buildup of material on the edges of the screed shall not be allowed.

The Contractor shall ensure that there is no gap of un-recycled pavement material created between successive cuts (along the same longitudinal cut line), nor wedges of un-recycled pavement material created by the entry of the milling drum into the existing material. Longitudinal joints between successive cuts shall overlap a minimum of 3 inches (75 mm) and transverse joints shall overlap a minimum of 2 feet (0.6 m).

When a paving fabric or other geosynthetic is encountered during the cold milling operation the Contractor shall make the necessary changes in equipment or operations so that incorporation of shredded material into the recycled material does not affect the performance parameters of the recycled pavement or inhibit placing and compaction of the CIR pavement. No fabric piece incorporated into the recycled section shall have any dimension exceeding a length of 2 inches (50 mm). The Contractor shall be required to remove and properly dispose of oversized pieces of paving fabric as indicated by the plans and specifications.

Rubberized crack filler, pavement markers, loop wires, thermoplastic markers and other similar materials shall be removed from the roadway as observed during the recycling process. Residual materials that cannot be completely removed from the processed RAP may be incorporated into the recycled mix if the Contractor can demonstrate that those added materials will not adversely affect the performance of the recycled pavement. Any such materials retained in the mix shall be appropriately sized and blended so as not to adversely affect the appearance or strength of the recycled pavement.

7.6 Compaction

The Contractor shall determine the time from which the treated material is placed until compaction can commence. Rolling patterns shall be established and the mixture compacted using the procedures established in section 7.3. Compaction shall be monitored using nuclear density testing in accordance with ASTM D2950, or Owner Agency approved method, throughout the time compaction is being completed to continuously verify the compaction is within $\pm 5\%$ of the target density established in section 7.3.

The selected rolling pattern shall be followed unless changes in the recycled mix or placement conditions occur and a new rolling pattern is established at that time. Any type of rolling that causes cracking, major displacement, and/or any other type of pavement distress shall be discontinued until

such time as the problem can be resolved. Discontinuation and commencement of rolling operations shall be at the discretion of the Owner Agency.

The recycled mat shall be continuously observed during compaction efforts. If moisture cracking occurs under vibratory compaction mode, the vibrators shall be turned off and static rolling only applied. If moisture cracking of the mat continues under static steel rolling, steel drum compaction shall cease, the mat shall be allowed to cure for a time in order for moisture to escape, and pneumatic rolling commenced, followed by steel drum rolling to correct irregularities from the pneumatic-tired roller(s). This procedure shall be followed until there is no longer any displacement of the mat observed from roller action on the recycled surface.

Care shall be taken to ensure that aggregate from the recycled mixture does not stick to the drums or wheels of rollers. Water shall be uniformly applied to the wheels and drums, along with mechanical means, if necessary, so as to keep aggregate from sticking. Sufficient water shall be applied to keep rollers and tires clean, but not to the extent that water pools or ponds on the recycled surface.

Rollers shall not be started or stopped on uncompacted recycled material. Rolling patterns shall be established so that starting and stopping shall be on previously compacted material or the adjacent, existing surfacing.

User Note: The time to begin compaction operations is dependent on the recycling agent used, foamed asphalt or emulsified asphalt, the type of emulsified asphalt recycling agent, additives (lime or cement), as well as climatic conditions.

There is not an AASHTO equivalent for ASTM D2950 *Density of Bituminous Concrete in Place by Nuclear Methods*. Many Owner Agencies have developed their own test methods for determining density of bituminous mixtures using nuclear methods and these procedures are acceptable substitutions. It has not been determined at this time if electromagnetic gauges are suitable for use on cold recycled mixtures; therefore, they are not recommended for use.

7.7 Curing

After compaction has been achieved and prior to opening the CIR pavement layer to traffic, a fog seal, if required, shall be applied to the recycled pavement surface. The fog seal shall be composed of either CSS-1h or SS-1h emulsified asphalt diluted up to 50 percent by volume with water or an engineered emulsion diluted up to 60 percent by volume with water. Fog seal shall be applied at a rate of 0.05 to 0.15 gal/yd², (0.2 to 0.7 L/m²). When a sand blotter is required, it shall be applied to the surface at approximately 2 to 3 lbs/yd² (1 to 5 kg/m²). Sand shall be free from clay or organic material. The application rates of the fog seal and sand blotter shall be determined by the Contractor and shall be such that a stable and safe roadway surface can be maintained until the surface course is placed.

Prior to placing the final surfacing or any secondary compaction, if required, the CIR shall meet the following criteria:

1. The completed CIR shall cure for a minimum of 3 days.
2. The moisture content shall be less than 3.0 percent. If the moisture content does not fall below the maximum limit of 3.0 percent after 10 days and if the roadway has been free of rain for a minimum of 2 days, the Contractor shall be permitted to place the final surfacing or perform the secondary compaction, as required.

User Note: In some areas secondary compaction is not necessary. It is commonly completed with an emulsified asphalt recycling agent but rarely performed with a foamed asphalt recycling agent, particularly if cement is added.

7.8 Secondary Compaction

If the recycling agent is emulsified asphalt, secondary compaction, if required, shall be conducted with pneumatic-tired and double drum vibratory rollers as per Section 6.9 after cure and before placing any final surfacing. Secondary compaction shall be completed after the morning sun has risen and when the pavement temperature is at least 80 °F (27 °C).

A new rolling pattern shall be established using the procedures of section 7.3 to determine the target density of secondary compaction. Density of the recycled pavement shall be verified behind the secondary compaction by nuclear density gauge in accordance with ASTM D2950 or Owner Agency equivalent procedure. Nuclear density testing shall be repeated throughout the time secondary compaction is being completed to continuously verify that the secondary compaction is within $\pm 5\%$ of the target density established. Care shall be taken not to over compact the mat. If cracking results, secondary compaction shall be ceased in that immediate area.

User Note: Consider suspending any secondary compaction if the pavement temperature never reaches 80 °F (27 °C) prior to scheduled placement of the surface course. In addition, a minimum of four passes should be attempted during establishment of the rolling pattern for secondary compaction as the density may decrease during the initial roller passes. The roller pattern is the number of passes resulting in the peak increase in density. If no increase in density is noted, or if the mat exhibits cracking, secondary compaction should be suspended.

7.9 Surface Tolerance

The finished surface and grade of the recycled material shall be checked regularly during placement using a straight edge. The surface tolerance shall not vary more than 3/8 inch (10 mm) from a 10-foot (3.0-m) straight edge placed on the surface. The Contractor shall correct humps exceeding this tolerance by reworking, rerolling, trimming, milling or abrasive grinding. Depressions exceeding this depth shall have a tack coat applied of either CSS-1h or SS-1h emulsified asphalt, or equivalent, at a minimum of 0.05 gal/yd² (0.2 L/m²) and filled with cold mix, recycled mix, warm mix asphalt (WMA) or hot mix asphalt (HMA) just prior to placement of the surface course.

7.10 Surfacing

Prior to placing the surface course, the recycled pavement shall be carefully swept of all loose material and any standing water. In the event that an HMA or WMA overlay is used as the surface course, a tack coat of either CSS-1h or SS-1h emulsified asphalt, or equivalent, at a minimum of 0.05 gal/yd² (0.2 L/m²) shall be applied to all surface areas. A hot asphalt binder tack coat shall not be used.

7.11 Maintenance

After opening to traffic and prior to placing the surface course, the surface of the recycled pavement shall be maintained in a condition suitable for the safe movement of traffic. The Contractor shall protect and maintain the recycled surface from nuisance water, other deleterious substances, and/or any other damage. Any damage to the completed recycled material shall be repaired by the Contractor prior to placement of the surface course. Areas of the CIR layer damaged as outlined in Table 3 shall be repaired in accordance with the procedures listed in Table 3. No direct payment will be made for repairs and costs shall be included elsewhere for protection and maintenance of the recycled asphalt pavement.

Damage caused by poor subgrade support shall be repaired by the Contractor as directed by the Owner Agency. Costs to repair damaged CIR due to the subgrade will be paid by the Owner Agency.

Table 3 – CIR DAMAGE AND MITIGATION	
Damage	Mitigation
Isolated areas of minor raveling or scuffing.	Sweep and monitor. Determine if fog sealing or re-fog sealing is necessary to protect.
Isolated areas of major raveling, scuffing or tearing.	Maintain better traffic restrictions in areas that are not cured. Sweep and monitor. Determine if fog sealing or re-fog sealing is necessary to protect. Fill or remove and replace deep damaged areas with asphalt mixture (cold mix, recycled mix, WMA, or HMA) prior to surface course.
Large scale areas of raveling, scuffing or tearing in straight traffic areas.	Re-recycle or remove and replace with asphalt mixture (cold mix, recycled mix, WMA, or HMA).
Dimpling due to parked vehicles or equipment.	Fill with asphalt mixture (cold mix, recycled mix, WMA, or HMA) prior to surface course.
Permanent deformation within wheel path areas due to secondary compaction by traffic.	If pavement temperatures permit, apply secondary compaction. Fill with asphalt mixture (cold mix, recycled mix, WMA, or HMA) or micro surfacing in the low areas or cold mill to provide a smooth surface.
Permanent deformation and shoving due to unstable mix.	Investigate pavement structure in conjunction with mix design lab. Depending on investigation, remove and replace affected areas with asphalt mixture (cold mix, recycled mix, WMA, or HMA) or re-recycle supplementing with uncoated coarse aggregate, additives and/or recycling agent as necessary.

8. Quality Control

The Contractor shall perform process and quality control (QC) sampling and testing, and exercise management control to ensure that cold in-place recycling conforms to the project specifications. Sampling and testing shall be performed as outlined in *ARRA CR301 - Recommended Quality Control Guidelines For Cold In-place Recycling Using a Bituminous Recycling Agent*. The Contractor shall provide a qualified technician, testing laboratory and personnel to perform process and quality control sampling and testing during the cold in-place recycling, spreading, compaction, and finishing. The proficiency of testing laboratories and sampling and testing personnel shall be reviewed and approved by the Owner Agency prior to providing services to the project. The Owner Agency shall have unrestricted access to the laboratory, sampling, testing sites, and all information resulting from mix design and quality control activities. All quality control testing results shall be submitted to the Owner Agency.

9. Measurement and Payment

Quantities of the produced CIR pavement shall be measured by the square yard (square meter) completed and accepted by the Owner Agency for the depths specified. Recycling agent and additive weight shall be based on certified delivery weigh tickets, less any unused portion. Water used in the CIR operation will not be paid for directly and shall be considered subsidiary to the bid item.

Payment for CIR shall be made at the contract unit price per square yard (square meter). The price shall be full compensation for all labor, materials, tools, equipment, and incidentals; for doing all the work involved in cold in-place recycling, completed in-place; for milling, crushing, sizing, mixing, blending, placing, and compacting the recycled pavement mixture; for protection and maintenance of the recycled layer, with the exception of poor subgrade areas; for performing all QC testing including mix design, if required to be provided by Contractor; for PPT training and instructor, if required to be provided by Contractor; for fog sealing, sanding and sweeping if necessary; for obtaining measurements and recording results of all tests as shown on the plans and specifications.

Bituminous recycling agent will be paid for at the contract price per ton (metric ton).

Additives will be paid for by force account if determination is made during the mix design that additives are necessary.

Subgrade repair areas will be paid for by force account.
