1.0 INTRODUCTION

The purpose of this investigation was to determine the presence or absence of contamination in soil and/or groundwater that would affect the proposed development at the Red Hook Site located in Brooklyn, New York (the Site). The legal definition of the subject property is Tax Block 489 Lot 1, Tax Block 491 Lot 1, Tax Block 493 Lot 1, and Tax Block 95 Lot 1. The site location is shown on Figure 1. The site includes one and multi-story commercial warehouses for tires sale.

2.0 SITE BACKGROUND INFORMATION

2.1 Site Location and Description

The site is located in a mixed-use commercial area of the Borough of Brooklyn, New York and currently contains three one-story, and one one-story warehouses and large parking areas/storage yards. The subject Site is bounded to the north by Creamer Street, to the east by Gowanus Canal, to the south by Percival Street, and to the west by Smith Street. The surrounding neighborhood is primarily commercial with a few residential buildings.

2.2 Site History and Specific Environmental Concerns

Reviewing the 1904 historical Sanborn map indicated that Block 493, Lot 1 located at 627-641 Smith Street and Block 492 Lot 1 located at 610-628 Smith Street were occupied by Barrett Manufacturing Company. Barrett Manufacturing Company was a producer of coal tar and roofing material. Roofing material was made by dropping roofing paper or felt into saturating tanks filled with coal tar. The property located on Block 493 Lot 1 contained four tar tanks with capacities ranged between 50 barrel (2,100 gallons) and 1,457 barrel (62,450 gallons) where the coal tar was stored. Underground gasoline tanks with unknown capacities and tar pumps were also identified on the property. Five additional tar tanks were added on the property located on Block 493 Lot 1 as shown in the 1915 historical Sanborn maps. Former coal tar and gasoline tank location are shown in Figure 2.

Between 1904 and 1938, Block 495 Lot 1 located at 543-661 Smith Street was occupied by American Ice Company, N.Y. Knickerbocker Real Estate Company, and Seaboard Storage Corporation. No industrial activities were indicated on the Fire Insurance maps for this Block.

Between 1904 and 1938, Block 491 Lot 1 located at 611-625 Smith Street and Block 489 Lot 1 located at 595-609 Smith Street were occupied by S.W. Bowne and were used as hay storage and grain warehouse. The two blocks were then occupied by Bowne-Morton's Stores Inc. and were used as warehouses.

The past on-site and off-site land uses may have resulted in releases of contaminants to soil and/or groundwater beneath the site, including petroleum products.

2.3 Site Specific Investigation Objectives

The purpose of this investigation was to: evaluate whether soil and/or groundwater contamination is present at the site and to estimate an approximate cost for appropriate remediation of soil and groundwater.

The environmental investigation consisted of the advancement of ten environmental soil borings (GP-1 to GP-10) and installation of temporary wells at six of these locations, as shown on Figure 2. Soil samples were field-screened for volatile organic compounds, and soil and groundwater samples were collected for laboratory analyses. The investigation

activities were conducted in accordance with a Phase II Subsurface Investigation proposal dated March 30, 2005.

3.0 SITE DESCRIPTION

3.1 Surface and Subsurface Conditions

Based on reports compiled by the U.S. Geological Survey, the property lies at an elevation of approximately 7 to 9 feet above the National Geodetic Vertical Datum of 1929 (an approximation of mean sea level), and slopes slightly to the east, towards the Gowanus Canal.

According to soil borings installed at the site during this investigation, the site is underlain by three to seven feet of miscellaneous fill, silt sand, and organic clay. During the current investigation, groundwater beneath the study site was encountered at depths ranging from approximately 4 to 7 feet below ground surface. Groundwater likely flows east toward the Gowanus Canal. However, actual groundwater flow at the site can be affected by many factors including past filling activities, underground utilities, and other subsurface openings or obstructions.

3.2 Previous Environmental Investigation

A Phase I Environmental Site Assessment of the site was performed by Singer Environmental Group in February 1, 2005. This assessment included a site inspection and a review of available historical Sanborn Maps, New York City Fire Department (FDNY) records, New York City Department of Buildings records, and federal and state regulatory databases. No soil and/or groundwater investigations were conducted on the site.

Based on the historical Sanborn Maps included in the Phase I Environmental Site Assessment, FLS recommended a Phase II subsurface investigation for the site.

4.0 METHODOLOGY

4.1 Ground Penetrating Radar Survey

A Ground-Penetrating Radar (GPR) survey was performed in the area of the former tar and gasoline tank locations. The purpose of this survey was to identify any subsurface anomalies such as underground tanks or/and foundation of former aboveground tanks. The survey was performed in a linear pattern (narrow strips) along the former tar and gasoline tank locations. Due to the limited space, the survey could not be performed over a grid pattern to obtain accurate subsurface anomalies. However, no anomalies indicative of underground tanks were identified. A copy of the GPR survey report is attached in Appendix A.

4.2 Sampling Program Methodology

The environmental investigation sampling program consisted of the advancement of ten soil borings and installation of temporary wells at six of these locations, as shown on Figure 2. Soil borings GP-1, GP-2, GP-5, and GP-6 were advanced in Block 493 Lot 1; borings GP-3 and GP-4 were advanced in Block 495 Lot 1; borings GP-7 and GP-10 were advanced in Block 491 Lot1; and borings GP-8 and GP-9 were advanced in Block 489 Lot 1.

4.3 Soil Sampling

Soil samples were collected from each of the ten soil borings. Boring locations were biased towards the areas of former tar and gasoline tanks on Block 493 Lot 1, while also obtaining a wide distribution of subsurface conditions across the other Blocks of site.

At each of the ten soil boring locations, truck-mounted and hand-held geoprobe units were used to advance soil borings. Soil samples were obtained by a 4-foot steel sampler which contains a dedicated plastic liner. Each sampler was driven through the subsurface soil to collect soil samples at four foot intervals to the soil/groundwater interface. The soil was field screened using a photoionization detector (PID) and described in two foot intervals inside each plastic liner along the vertical depth of each boring. FLS personnel described the soil using the modified Burmeister Classification System, and recorded PID readings and visual and olfactory observations on soil boring logs attached in Appendix B.

One soil sample was collected for laboratory analysis at each boring location. This soil sample was biased towards the highest PID readings. The soil samples were containerized in accordance with EPA analytical protocols. Each sample was labeled, sealed, and placed in a chilled cooler for shipment to Severn Trent Laboratory. Each soil sample was analyzed for volatile organic compounds (VOCs) by EPA Method 8260 and semivolatile organic compounds (SVOCs) by EPA Method 8270. A summary of laboratory results compared to NYSDEC Technical and Administrative Guidance Memorandum #4046 (TAGM 4046) Recommended Soil Cleanup Objectives is provided in Tables 1 and 2.

4.4 Groundwater Sampling

Temporary wells were installed in borings GP-2 to GP7. The wells were installed to depths ranging from 8 to 15 feet below grade.

At each boring location, direct push groundwater sampling was performed by pushing a one-inch diameter hollow steel rod into the ground to five feet below the groundwater interface approximately 15 feet below grade). When the bottom of the probe is at the

desired depth, the outer cylinder was pulled back exposing a perforated stainless steel sample entry barrel covered with either a nylon or polyethylene filter material. Hydrostatic pressure forces ground water into the sample compartment. Half-inch diameter polyethylene tubing with a check valve was inserted inside the hollow steel rod and sent down to the sample compartment to collect a groundwater sample.

Each sample was labeled, sealed, and placed in a chilled cooler for shipment to Severn Trent Laboratory. Groundwater samples were analyzed for VOCs by EPA Method 8260 and SVOCs by EPA Method 8270. A summary of laboratory results compared to the NYSDEC Class GA Groundwater standards is provided in Tables 3 to 4.

5.0 FINDINGS

5.1 Geology and Hydrogeology

Light brown to tan sandy silt fill material was present in soil borings from just below the concrete slab inside the warehouses on Blocks 493 and 495 and ground surface outside the warehouse to approximately 7 to 15 feet below grade. Below the fill is a layer of gray organic clay.

Groundwater was encountered at depths ranging from approximately 4 to 10 feet below ground surface.

5.2 Soil Contamination

5.2.1 Field Observations

Coal tar-like free product was observed in the soil samples collected from 3 to 8 feet below the concrete slab in borings GP-2 and GP-6 on Block 493 Lot 1 and in boring GP-3 on Block 495 Lot 1. Petroleum-like odors and elevated PID readings (230 parts per million, [ppm]) were noted in soil collected from 7 to 8 feet in boring GP-7 located on Block 491 near Smith Street. No other staining, odors, elevated PID readings or other visual or olfactory evidence of contamination was noted in the soil samples collected from Block 489 Lot 1.

5.2.2 Volatile Organic Compounds (VOCs)

Laboratory analytical results for VOCs in soil are provided in Appendix C and summarized in Table 1.

Soil samples from locations GP-2 from 2 to 3 feet, GP-3 from 6 to 8 feet, and GP-6 from 4 to 6 feet had high concentrations of VOCs, most notably benzene, toluene, ethylbenzene, and xylenes (BTEX). Soil samples with high levels of VOCs were concentrated in the area of the former tar tank locations on the south and southwestern portion of Block 493 Lot 1 and on the north area of Block 495 Lot 1. BTEX levels in the soil at these locations ranged from 12,800 ppm to 1,032,000 ppm.

VOCs were also detected in borings GP-1 from 2 to 3 feet, GP-5 from 6 to 8 feet, and GP-7 from 4 to 6 feet. However, the detected VOCs were below the Recommended Soil Cleanup Objectives (RSCOs) listed in NYSDEC Technical and Administrative Guidance Memorandum (TAGM) No. 4046 except for benzene in the soil sample GP-1. Acetone and/or methylene chloride were detected in all samples and method blanks. These compounds are, therefore, likely laboratory artifacts.

5.2.3 Semivolatile Organic Compounds (SVOCs)

Laboratory analytical results for SVOCs in soil are provided in Appendix C and summarized in Table 2.

Soil samples from boring locations GP-1, GP-2, GP-3, GP-6, and GP-7 showed high levels of semivolatile compounds. For each sample analyzed, the sum of semivolatile values—including that for naphthalene—was calculated in order to determine the amount of total target compound polynuclear aromatic hydrocarbons (PAH's). Total PAHs in the soil samples ranged from 0.95 ppm to 473,880 ppm.

5.3 Groundwater Contamination

5.3.1 Field Observations

To test the feasibility of free product collection and to measure the thickness of the free product, two one-inch piezometers were installed on Block 493 Lot 1: one piezometer in the area of the former coal tar tank locations and one near the Gowanus Canal, downgradient of the former tar tank locations. Due to the limited access of the site, no permanent monitoring wells could be installed.

One week after the installation of the two piezometers, they were checked for free product using a Teflon bailer. A layer with an approximately five inches thick of coal tar product was measured in piezometer GP-2. No measurable thickness of free product could be observed in piezometer GP-6. However, the exterior of the bailer was stained with coal tar. It should be noted that in order to test the free product collection and measure its thickness appropriately, 4-inch monitoring/collection wells need to be installed in the areas where the free product was observed.

5.3.2 Volatile Organic Compounds (VOCs)

Laboratory analytical results for VOCs in groundwater are provided in Appendix C and summarized in Table 3.

Although groundwater is not a source of potable water in Brooklyn, as a means of comparison, the results were compared to NYSDEC Class GA Groundwater Standard (Division of Water Technical and Operational Guidance Series [1.1.1]). VOCs were detected in all six groundwater samples at concentrations above the NYSDEC class GA groundwater standard. Total concentration of benzene, toluene, ethylbenzene and total xylenes in the six groundwater samples ranged from 21 to 10,789 µg/L. Methyl-tert-butyl-ether (MTBE) was detected in five of the six groundwater samples. The concentrations of MTBE ranged from 3.1 to 240 µg/L. Acetone and/or methylene chloride were detected in all samples and method blanks. These compounds are, therefore, laboratory artifacts.

5.3.3 Semivolatile Organic Compounds (SVOCs)

Laboratory analytical results for SVOCs in groundwater are provided in Appendix C and summarized in Table 4.

Semivolatile compounds were detected in all six groundwater samples with naphthalene concentrations ranging from 260 µg/L to 33,000 µg/L. There is no standard for naphthalene, but the guidance level is 10 µg/L.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The investigation revealed the following environmental conditions in connection with the property:

- Upon discovering free product in soil boring locations GP-2 and GP-6, FLS called in a spill to the New York State Department of Environmental Conservation (NYSDEC). The spill number for this incident is 0500510. Soil borings GP-2 and GP-6 were located in the area of the former tar tanks and adjacent to the Gowanus Canal on Block 395 Lot 1.
- Elevated levels of BTEX were detected in soil samples GP-2 from 2 to 3 feet, GP-3 from 6 to 8 feet, and GP-6 from 4 to 6 feet. The VOCs with naphthalene detected in the soil samples are related to the coal tar that was used historically in roofing material manufacturing. The high levels of SVOCs detected in soil samples from borings GP-1, GP-2, GP-3, and GP-6 located on Block 493 Lot 1 and Block 495 Lot 1 included polycyclic aromatic hydrocarbons (PAHs) and naphthalene. PAHs and naphthalene are a class of compounds present in coal tar, petroleum products, asphalt, and as byproducts of combustion. The areas of elevated PAHs and naphthalene correspond to elevated levels of VOCs, and were in the vicinity of the former tar tank locations. Therefore, the detected PAH and naphthalene contamination appear to be related to a release of coal tar that was historically used on Block 493 Lot 1 by Barrett Manufacturing Company.
- BTEX were detected in all six groundwater samples at concentrations above the NYSDEC class GA groundwater standard. Elevated BTEX concentrations at three of these locations (GP-4, GP-5, and GP-7) are likely associated with an off-site source due to their proximity to the property line along Smith Street. Elevated BTEX concentrations at the other three locations (GP-2, GP-3, and GP-6 located on Block 493 Lot 1) are likely related to on-site historical use of the coal tar.
- Methyl-tert-butyl-ether (MTBE) was detected in five of the six groundwater samples. The concentrations of MTBE ranged from 3.1 to 240 µg/L. The presence of the MTBE in groundwater most likely is related to an off-site source.
- The groundwater samples from all six groundwater samples (GP-2 to GP-7) contained SVOC concentrations above the standard/guidance. The detected level of naphthalene in the six groundwater samples ranging from 260 µg/L to 33,000 µg/L. The detected SVOCs in groundwater samples GP-4, GP-5, and GP-7 are likely associated with an off-site source due to their proximity to the property line along Smith Street. The detected SVOCs in groundwater samples GP-2, GP-3, and GP-6 are most likely related to on-site historical use of the coal tar.

Based upon this site investigation, FLS has the following recommendations:

- A report summarizing the findings shall be sent to the NYSDEC to respond to the reported spill.
- A remediation plan will need to be developed and presented to NYSDEC. If the site will be developed, the development and remediation could proceed simultaneously.
- Further testing will be required to determine the vertical and horizontal extent of the contamination found in the soil and groundwater. Coal tar may be heavier than groundwater and sink to bedrock. Deep soil and groundwater testing will be necessary to determine if deep contamination exists under the site.

- If no development is imminent for the site, the free product could be removed by using in-situ pumping systems and soils bio-remediated by oxygenating the soil and groundwater allowing the site to continue in use while remediated.
- The site is a candidate for the New York State Brownfield program which provides tax credits for redevelopment of contaminated sites and a release from future liability at completion of the agreed upon clean-up.
- The cost of the clean-up cannot be accurately estimated until more detailed sampling is performed to determine the nature and extent of the contamination. Of particular interest on this site is the potential for contamination to sink deep down to bedrock. Coal tar, the raw material for roofing manufacture and creosote, a distillation by-product of this manufacture are often heavier than water. The contamination found in the shallow soils were coal tar products.
- While the information from this sampling is limited, the areas that we detected gross contamination and the potential that this contamination may be found deeply under the site lead us to conclude that the worst case remediation cost for this site could be in the range of \$4 to \$6 million. These costs include detailed site sampling (\$200,000 to \$300,000), Development of a Remedial Action Work Plan (RAWP) under the Brownfield Program (\$200,000), and execution of the approved RAWP (\$3.5 to 5.5 million).
- The Company that manufactured roofing on this site, the Barrett Manufacturing Company merged into Allied Chemical and Dye Company in 1920. Allied is the predecessor company to Honeywell Corporation. There may be an opportunity to recover some of the remediation costs for this remediation from Honeywell.
