Relational algebra

## Relational Algebra

- Procedural language
- Six basic operators
- select: $\sigma$
- project: П
- union: $\cup$
- set difference: -
- Cartesian product: $x$
- rename: $\rho$
- The operators take one or two relations as inputs and produce a new relation as a result.

## Select Operation - Example

Relation r

| $A$ | $B$ | $C$ | $D$ |
| :---: | :---: | :---: | :---: |
| $\alpha$ | $\alpha$ | 1 | 7 |
| $\alpha$ | $\beta$ | 5 | 7 |
| $\beta$ | $\beta$ | 12 | 3 |
| $\beta$ | $\beta$ | 23 | 10 |

$$
\sigma_{A=B \wedge D>5}(r) \quad \begin{array}{|c|c|c|c|}
\hline A & B & C & D \\
\hline \hline \alpha & \alpha & 1 & 7 \\
\beta & \beta & 23 & 10 \\
\hline
\end{array}
$$

## Select Operation

- Notation: $\sigma_{p}(r)$
- $p$ is called the selection predicate
- Defined as:

$$
\sigma_{p}(\boldsymbol{r})=\{t \mid t \in r \text { and } p(t)\}
$$

Where $p$ is a formula in propositional calculus consisting of terms connected by : $\wedge$ (and), $\vee$ (or), $\neg$ (not) Each term is one of:
<attribute>op <attribute> or <constant>
where op is one of: $=, \neq,>, \geq .<. \leq$

- Example of selection:

$$
\sigma_{\text {dept_name="Physicss }} \text { (instructor) }
$$

## Project Operation - Example

Relation $r$.

| $A$ | $B$ | $C$ |
| :--- | :--- | :--- |
| $\alpha$ | 10 | 1 |
| $\alpha$ | 20 | 1 |
| $\beta$ | 30 | 1 |
| $\beta$ | 40 | 2 |

$\Pi_{\mathrm{A}, \mathrm{C}}(r)$

| $A$ | $C$ |
| :--- | :--- |
| $\alpha$ | 1 |
| $\alpha$ | 1 |
| $\beta$ | 1 |
| $\beta$ | 2 |$=$| $A$ | $C$ |
| :--- | :--- |
| $\alpha$ | 1 |
| $\beta$ | 1 |
| $\beta$ | 2 |

## Project Operation

- Notation:

$$
\prod_{A_{1}, A_{2}, \ldots, A_{k}}(r)
$$

where $A_{1}, A_{2}$ are attribute names and $r$ is a relation name.

- The result is defined as the relation of $k$ columns obtained by erasing the columns that are not listed
- Duplicate rows removed from result, since relations are sets
- Example: To eliminate the dept_name attribute of instructor

$$
\prod_{I D, \text { name, salar }} \text { (instructor) }
$$

## Union Operation - Example

Relations $r$, $s$ :

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 1 |
| $\alpha$ | 2 |
| $\beta$ | 1 |
| $r$ |  |$\quad$| $A$ | $B$ |
| :---: | :---: | :---: |
| $\alpha$ | 2 |
| $\beta$ | 3 |

$r \cup s:$

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 1 |
| $\alpha$ | 2 |
| $\beta$ | 1 |
| $\beta$ | 3 |

## Union Operation

- Notation: $r \cup s$
- Defined as:

$$
r \cup s=\{t \mid t \in r \text { or } t \in s\}
$$

- For $r \cup s$ to be valid.

1. $r, s$ must have the same arity (same number of attributes)
2. The attribute domains must be compatible (example: $2^{\text {nd }}$ column of $r$ deals with the same type of values as does the $2^{\text {nd }}$ column of $s$ )

- Example: to find all courses taught in the Fall 2009 semester, or in the Spring 2010 semester, or in both
$\Pi_{\text {course_id }}\left(\sigma_{\text {semester="Fall" } \wedge \text { year=2009 }}(\right.$ section $\left.)\right) \cup$
$\Pi_{\text {course_id }}\left(\sigma_{\text {semester="Spring" }} \wedge\right.$ year=2010 $($ section $\left.)\right)$

## Set difference of two relations

Relations $r$, $s$ :

$r-s:$

| $A$ | $B$ |
| :--- | :--- |
| $\alpha$ | 1 |
| $\beta$ | 1 |

## Set Difference Operation

- Notation $r-s$
- Defined as:

$$
r-s=\{t \mid t \in r \text { and } t \notin s\}
$$

- Set differences must be taken between compatible relations.
- $r$ and $s$ must have the same arity
- attribute domains of $r$ and $s$ must be compatible
- Example: to find all courses taught in the Fall 2009 semester, but not in the Spring 2010 semester
$\prod_{\text {course_id }}\left(\sigma_{\text {semester="Fall" }}\right.$ ^ year=2009 $($ section)) -
$\prod_{\text {course_id }}\left(\sigma_{\text {semester="Spring" }}\right.$ ^ year=2010 (section))

## Cartesian-Product Operation - Example

Relations $r, s$ :

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 1 |
| $\beta$ | 2 |
| $r$ |  |

| $C$ | $D$ | $E$ |
| :--- | :--- | :--- |
| $\alpha$ | 10 | a |
| $\beta$ | 10 | a |
| $\beta$ | 20 | b |
| $\gamma$ | 10 | b |

$S$
rxs:

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :--- | :--- | :--- | :--- | :--- |
| $\alpha$ | 1 | $\alpha$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 20 | b |
| $\alpha$ | 1 | $\gamma$ | 10 | b |
| $\beta$ | 2 | $\alpha$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 20 | b |
| $\beta$ | 2 | $\gamma$ | 10 | b |

## Cartesian-Product Operation

- Notation $r \times s$
- Defined as:

$$
r \times s=\{t q \mid t \in r \text { and } q \in s\}
$$

- Assume that attributes of $\mathrm{r}(\mathrm{R})$ and $\mathrm{s}(\mathrm{S})$ are disjoint. (That is, $R \cap S=\varnothing$ ).
- If attributes of $r(R)$ and $s(S)$ are not disjoint, then renaming must be used.

## Composition of Operations

- Can build expressions using multiple operations
- Example: $\sigma_{\mathrm{A}=\mathrm{C}}(r \times s)$
- rxs

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :--- | :--- | :--- | :--- | :--- |
| $\alpha$ | 1 | $\alpha$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 20 | b |
| $\alpha$ | 1 | $\gamma$ | 10 | b |
| $\beta$ | 2 | $\alpha$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 20 | b |
| $\beta$ | 2 | $\gamma$ | 10 | b |

- $\sigma_{\mathrm{A}=\mathrm{C}}(r \times s)$

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :--- | :--- | :--- | :--- | :--- |
| $\alpha$ | 1 | $\alpha$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 20 | b |

## Rename Operation

- Allows us to name, and therefore to refer to, the results of relational-algebra expressions.
- Allows us to refer to a relation by more than one name.
- Example:

$$
\rho_{x}(E)
$$

returns the expression $E$ under the name $X$

- If a relational-algebra expression $E$ has arity $n$, then

$$
\rho_{x\left(A_{1}, A_{2}, \ldots, A_{n}\right)}(E)
$$

returns the result of expression $E$ under the name $X$, and with the attributes renamed to $A_{1}, A_{2}, \ldots, A_{n}$.

## Example Query

- Find the largest salary in the university
- Step 1: find instructor salaries that are less than some other instructor salary (i.e. not maximum)
-using a copy of instructor under a new name $d$
$\prod_{\text {instructor.salary }}\left(\sigma_{\text {instructor.salary }}\right.$ d.salary
(instructor x $\rho_{d}$ (instructor)))
- Step 2: Find the largest salary
$\Pi_{\text {salary }}$ (instructor) -
$\prod_{\text {instructor.salary }}$ ( $\sigma_{\text {instructor.salary }}$ d.salary
(instructor $x \rho_{d}$ (instructor)))

## Example Queries

- Find the names of all instructors in the Physics department, along with the course_id of all courses they have taught
- Query 1
$\prod_{\text {instructor.ID,course_id }}\left(\sigma_{\text {dept_name='Physics" }}(\right.$
$\sigma_{\text {instructor.ID=teaches.ID }}($ instructor x teaches) $)$ )
- Query 2
$\prod_{\text {instructor.ID,course_id }}\left(\sigma_{\text {instructor.ID=teaches.ID }}\right.$ (

$$
\sigma_{\text {dept_name="Physics" }}(\text { instructor) } \times \text { teaches)) }
$$

## Formal Definition

- A basic expression in the relational algebra consists of either one of the following:
- A relation in the database
- A constant relation
- Let $E_{1}$ and $E_{2}$ be relational-algebra expressions; the following are all relational-algebra expressions:
$-E_{1} \cup E_{2}$
- $E_{1}-E_{2}$
- $E_{1} \times E_{2}$
- $\sigma_{p}\left(E_{1}\right), P$ is a predicate on attributes in $E_{1}$
$-\Pi_{s}\left(E_{1}\right), S$ is a list consisting of some of the attributes in $E_{1}$
- $\rho_{x}\left(E_{1}\right), \mathrm{x}$ is the new name for the result of $E_{1}$

## Additional Operations

We define additional operations that do not add any power to the relational algebra, but that simplify common queries.

- Set intersection
- Natural join
- Assignment
- Outer join

## Set-Intersection Operation

- Notation: $r \cap s$
- Defined as:
- $r \cap s=\{t \mid t \in r$ and $t \in s\}$
- Assume:
- $r, s$ have the same arity
- attributes of $r$ and $s$ are compatible
- Note: $r \cap s=r-(r-s)$

## Set-Intersection Operation - Example

- Relation $r, s$ :

| A | $B$ | A | $B$ |
| :---: | :---: | :---: | :---: |
| $\alpha$ | 1 | $\alpha$ | 2 |
| $\alpha$ | 2 | $\beta$ | 3 |
| $\beta$ | 1 |  | S |

- $r \cap s$

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 2 |

## Natural-Join Operation

- Let $r$ and $s$ be relations on schemas $R$ and $S$ respectively. Then, $\mathrm{r} \bowtie \mathrm{s}$ is a relation on schema $R \cup S$ obtained as follows:
- Consider each pair of tuples $t_{r}$ from $r$ and $t_{s}$ from $s$.
- If $t_{r}$ and $t_{s}$ have the same value on each of the attributes in $R \cap S$, add a tuple $t$ to the result, where
- $t$ has the same value as $t_{r}$ on $r$
- $t$ has the same value as $t_{s}$ on $s$
- Example:
$R=(A, B, C, D)$
$S=(E, B, D)$
- Result schema $=(A, B, C, D, E)$
$-r \bowtie s$ is defined as:

## Natural Join Example

- Relations r, s:

| $A$ | $B$ | $C$ | $D$ |
| :---: | :---: | :---: | :---: |
| $\alpha$ | 1 | $\alpha$ | a |
| $\beta$ | 2 | $\gamma$ | a |
| $\gamma$ | 4 | $\beta$ | b |
| $\alpha$ | 1 | $\gamma$ | a |
| $\delta$ | 2 | $\beta$ | b |
|  |  |  |  |
| $\gamma$ |  |  |  |

| $B$ | $D$ | $E$ |
| :---: | :---: | :---: |
| 1 | a | $\alpha$ |
| 3 | a | $\beta$ |
| 1 | a | $\gamma$ |
| 2 | b | $\delta$ |
| 3 | b | $\varepsilon$ |
| $s$ |  |  |

$r \bowtie s$

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :---: | :---: | :---: | :---: | :---: |
| $\alpha$ | 1 | $\alpha$ | a | $\alpha$ |
| $\alpha$ | 1 | $\alpha$ | a | $\gamma$ |
| $\alpha$ | 1 | $\gamma$ | a | $\alpha$ |
| $\alpha$ | 1 | $\gamma$ | a | $\gamma$ |
| $\delta$ | 2 | $\beta$ | b | $\delta$ |

## Natural Join and Theta Join

- Find the names of all instructors in the Comp. Sci. department together with the course titles of all the courses that the instructors teach
$-\Pi_{\text {name, title }}\left(\sigma_{\text {dept_name="Comp. Sci." }}\right.$ (instructor $\bowtie$ teaches $\bowtie$ course))
- Natural join is associative
- (instructor $\bowtie$ teaches) $\bowtie$ course $\quad$ is equivalent to instructor $\bowtie$ (teaches $\bowtie$ course)
- Natural join is commutative
- instruct $\bowtie$ teaches is equivalent to teaches $\bowtie$ instructor
- The theta join operation $r \bowtie_{\theta} s$ is defined as
$-r \bowtie{ }_{\theta} s=\sigma_{\theta}\left(\begin{array}{ll} & x\end{array}\right)$

## Assignment Operation

- The assignment operation $(\leftarrow)$ provides a convenient way to express complex queries.
- Write query as a sequential program consisting of
- a series of assignments
- followed by an expression whose value is displayed as a result of the query.
- Assignment must always be made to a temporary relation variable.

## Outer Join

- An extension of the join operation that avoids loss of information.
- Computes the join and then adds tuples form one relation that does not match tuples in the other relation to the result of the join.
- Uses null values:
- null signifies that the value is unknown or does not exist
- All comparisons involving null are (roughly speaking) false by definition.

## Outer Join - Example

- Relation instructor1

| ID | name | dept_name |
| :--- | :--- | :---: |
| 10101 | Srinivasan | Comp. Sci. |
| 12121 | Wu | Finance |
| 15151 | Mozart | Music |

- Relation teaches1

| ID | course_id |
| :--- | :--- |
| 10101 | CS-101 |
| 12121 | FIN-201 |
| 76766 | BIO-101 |

## Outer Join - Example

- Join instructor $\bowtie$ teaches

| $I D$ | name | dept_name | course_id |
| ---: | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |

- Left Outer Join
instructor $\beth$ teaches

| ID | name | dept_name | course_id |
| :---: | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |
| 15151 | Mozart | Music | null |

## Outer Join - Example

-Right Outer Join
instructor $\bowtie_{-}$teaches

| ID | name | dept_name | course_id |
| :---: | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |
| 76766 | null | null | BIO-101 |

- Full Outer Join
instructor $\ \times$ teaches

| $I D$ | name | dept_name | course_id |
| :--- | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |
| 15151 | Mozart | Music | null |
| 76766 | null | null | BIO-101 |

## Outer Join using Joins

- Outer join can be expressed using basic operations
- e.g. $r \beth \npreceq s$ can be written as

$$
(r \bowtie s) \cup\left(r-\prod_{R}(r \bowtie s) \times\{(n u l l, \ldots, n u l l)\}\right.
$$

## Null Values

- It is possible for tuples to have a null value, denoted by null, for some of their attributes
- null signifies an unknown value or that a value does not exist.
- The result of any arithmetic expression involving null is null.
- Aggregate functions simply ignore null values (as in SQL)
- For duplicate elimination and grouping, null is treated like any other value, and two nulls are assumed to be the same (as in SQL)

## Null Values

- Comparisons with null values return the special truth value: unknown
- If false was used instead of unknown, then not $(A<5)$ would not be equivalent to $\quad A>=5$
- Three-valued logic using the truth value unknown:
- OR: (unknown or true) = true, (unknown or false) = unknown
(unknown or unknown) = unknown
- AND: (true and unknown) = unknown, (false and unknown) = false,
(unknown and unknown) = unknown
- NOT: (not unknown) = unknown
- In SQL " $P$ is unknown" evaluates to true if predicate $P$ evaluates to unknown
- Result of select predicate is treated as false if it evaluates to unknown

## Division Operator

- Given relations $r(R)$ and $s(S)$, such that $S \subset R, r \div s$ is the largest relation $t(R-S)$ such that

$$
t x s \subseteq r
$$

- E.g. let $r\left(I D\right.$, course_id) $=\prod_{I D, \text { course_id }}$ (takes ) and

$$
\mathrm{s}\left(\text { course_id) }=\prod_{\text {course_id }} \text { ( } \sigma_{\text {dept_name= }{ }^{\text {Biologyy }}} \text { (course }\right)
$$

then $r \div$ s gives us students who have taken all courses in the Biology department

- Can write $r \div s$ as

$$
\begin{aligned}
& \text { temp1 } \leftarrow \prod_{R-S}(r) \\
& \text { temp2 } \leftarrow \prod_{R-S}\left((\text { temp1 xs })-\prod_{R-S, S}(r)\right) \\
& \text { result }=\text { temp1 }- \text { temp2 }
\end{aligned}
$$

- The result to the right of the $\leftarrow$ is assigned to the relation variable on the left of the $\leftarrow$.
- May use variable in subsequent expressions.

## Extended Relational-Algebra-Operations

- Generalized Projection
- Aggregate Functions

## Generalized Projection

- Extends the projection operation by allowing arithmetic functions to be used in the projection list.

$$
\prod_{F_{1}, F_{2}, \ldots, F_{n}}(E)
$$

- $E$ is any relational-algebra expression
- Each of $F_{1}, F_{2}, \ldots, F_{n}$ are are arithmetic expressions involving constants and attributes in the schema of $E$.
- Given relation instructor(ID, name, dept_name, salary) where salary is annual salary, get the sāme information but with monthly salary
$\prod_{D D, \text { name, dept_name, salany/12 }}$ (instructor)

## Aggregate Functions and Operations

- Aggregation function takes a collection of values and returns a single value as a result.
avg: average value
min: minimum value
max: maximum value sum: sum of values count: number of values
- Aggregate operation in relational algebra

$$
G_{1}, G_{2}, \ldots, G_{n} \mathcal{G}_{F_{1}\left(A_{1}\right), F_{2}\left(A_{2}, \ldots, F_{n}\left(A_{n}\right)\right.}(E)
$$

$E$ is any relational-algebra expression
$-G_{1}, G_{2} \ldots, G_{n}$ is a list of attributes on which to group (can be empty)

- Each $F_{i}$ is an aggregate function
- Each $A_{i}$ is an attribute name
- Note: Some books/articles use $\gamma$ instead of ${ }_{G}$ (Calligraphic G)

## Aggregate Operation - Example

- Relation $r$ :

| $A$ | $B$ | $C$ |
| :---: | :---: | :---: |
| $\alpha$ | $\alpha$ | 7 |
| $\alpha$ | $\beta$ | 7 |
| $\beta$ | $\beta$ | 3 |
| $\beta$ | $\beta$ | 10 |

$\mathcal{G}_{\text {sum(c) }}(r)$

```
sum ( \(c\) )
```

27

## Aggregate Operation - Example

- Find the average salary in each department ${ }_{\text {dept_name }} \mathcal{G}$ avg(salary) (instructor)

| ID | name | dept_name | salary |
| :--- | :--- | :--- | :--- |
| 76766 | Crick | Biology | 72000 |
| 45565 | Katz | Comp. Sci. | 75000 |
| 10101 | Srinivasan | Comp. Sci. | 65000 |
| 83821 | Brandt | Comp. Sci. | 92000 |
| 98345 | Kim | Elec. Eng. | 80000 |
| 12121 | Wu | Finance | 90000 |
| 76543 | Singh | Finance | 80000 |
| 32343 | El Said | History | 60000 |
| 58583 | Califieri | History | 62000 |
| 15151 | Mozart | Music | 40000 |
| 33456 | Gold | Physics | 87000 |
| 22222 | Einstein | Physics | 95000 |

| dept_name | avg_salary |
| :--- | :--- |
| Biology | 72000 |
| Comp. Sci. | 77333 |
| Elec. Eng. | 80000 |
| Finance | 85000 |
| History | 61000 |
| Music | 40000 |
| Physics | 91000 |

## Aggregate Functions (Cont.)

- Result of aggregation does not have a name
- Can use rename operation to give it a name
- For convenience, we permit renaming as part of aggregate operation

```
dept_name G avg(salary) as avg_sal (instructor)
```

## Modification of the Database

- The content of the database may be modified using the following operations:
- Deletion
- Insertion
- Updating
- All these operations can be expressed using the assignment operator

## Multiset Relational Algebra

- Pure relational algebra removes all duplicates
- e.g. after projection
- Multiset relational algebra retains duplicates, to match SQL semantics
- SQL duplicate retention was initially for efficiency, but is now a feature
- Multiset relational algebra defined as follows
- selection: has as many duplicates of a tuple as in the input, if the tuple satisfies the selection
- projection: one tuple per input tuple, even if it is a duplicate
- cross product: If there are $m$ copies of $t 1$ in $r$, and $n$ copies of $t 2$ in $s$, there are $m \times n$ copies of $t 1 . t 2$ in $r \times s$
- Other operators similarly defined
- E.g. union: $m+n$ copies, intersection: $\min (m, n)$ copies difference: $\min (0, m-n)$ copies

## SQL and Relational Algebra

- select A1, A2, .. An
from $r 1, r 2, \ldots, r m$ where $\mathbf{P}$
is equivalent to the following expression in multiset relational algebra

$$
\prod_{A 1, \ldots, A n}\left(\sigma_{P}(r 1 \times r 2 \times \ldots \times r m)\right)
$$

- select A1, A2, sum(A3)
from $r 1, r 2, \ldots, r m$
where $P$
group by A1, A2
is equivalent to the following expression in multiset relational algebra

$$
\left.{ }_{\mathrm{A} 1, \mathrm{~A} 2} \mathcal{G}_{\operatorname{sum}(A 3)}\left(\sigma_{P}(r 1 \times r 2 \times \ldots \times r m)\right)\right)
$$

## SQL and Relational Algebra

- More generally, the non-aggregated attributes in the select clause may be a subset of the group by attributes, in which case the equivalence is as follows:
select $A 1$, sum(A3)
from $r 1, r 2, \ldots, r m$
where P
group by A1, A2
is equivalent to the following expression in multiset relational algebra

$$
\prod_{A 1, \text { sumA3 }}\left({ }_{A 1, A 2} \quad \operatorname{sum}\left(A G_{\text {as sumA3 }}\left(\sigma_{P}(r 1 \times r 2 \times \ldots \times r m)\right)\right)\right.
$$
