RELATIONAL DATA MODEL

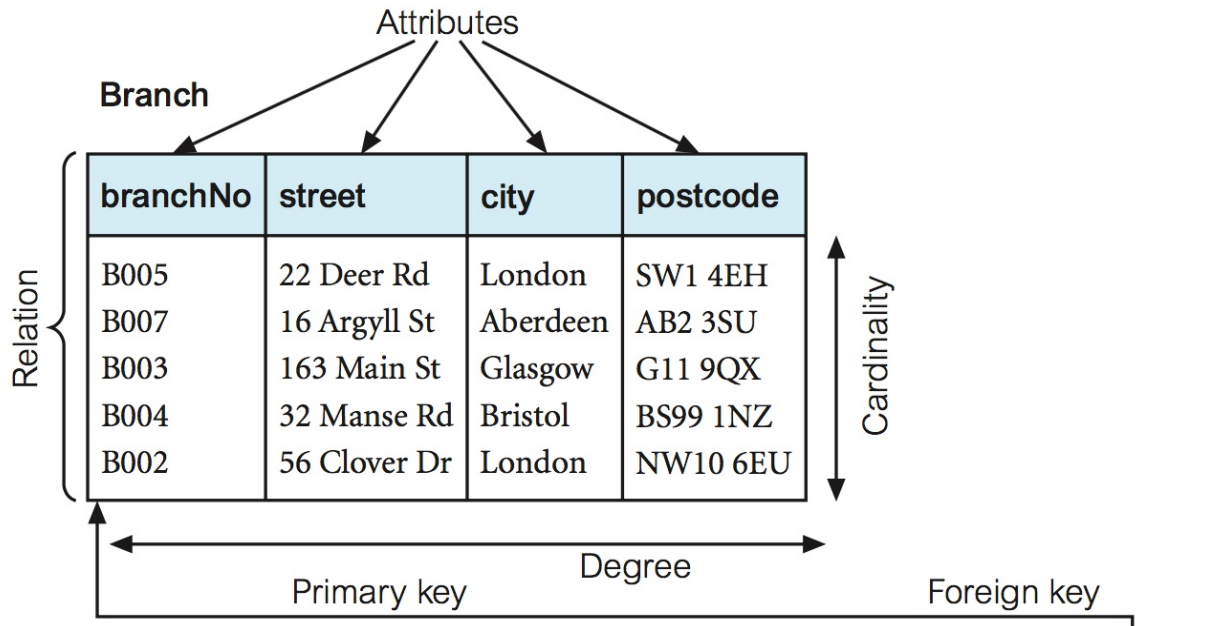
EGCO321 DATABASE SYSTEMS

KANAT POOLSAWASD
DEPARTMENT OF COMPUTER ENGINEERING
MAHIDOL UNIVERSITY

RELATIONAL DATA STRUCTURE (1)

- Relation: A relation is a table with columns and rows.
- Attribute: An attribute is a named column of a relation.
- Domain: A domain is the set of allowable values for one or more attributes.
- Tuple: A tuple is a row of a relation.
- Cardinality: The cardinality of a relation is the number of tuples it contains.
- Relational Database: A collection of normalized relations with distinct relation names.

RELATIONAL DATA STRUCTURE (2)



RELATIONAL DATA STRUCTURE (3)

Attribute	Domain Name	Meaning	Domain Definition
branchNo	BranchNumbers	The set of all possible branch numbers	character: size 4, range B001–B999
street	StreetNames	The set of all street names in Britain	character: size 25
city	CityNames	The set of all city names in Britain	character: size 15
postcode	Postcodes	The set of all postcodes in Britain	character: size 8
sex	Sex	The sex of a person	character: size 1, value M or F
DOB	DatesOfBirth	Possible values of staff birth dates	date, range from 1-Jan-20, format dd-mmm-yy
salary	Salaries	Possible values of staff salaries	monetary: 7 digits, range 6000.00–40000.00

ALTERNATIVE TERMINOLOGY

Formal terms	Alternative 1	Alternative 2
Relation	Table	File
Tuple	Row	Record
Attribute	Column	Field

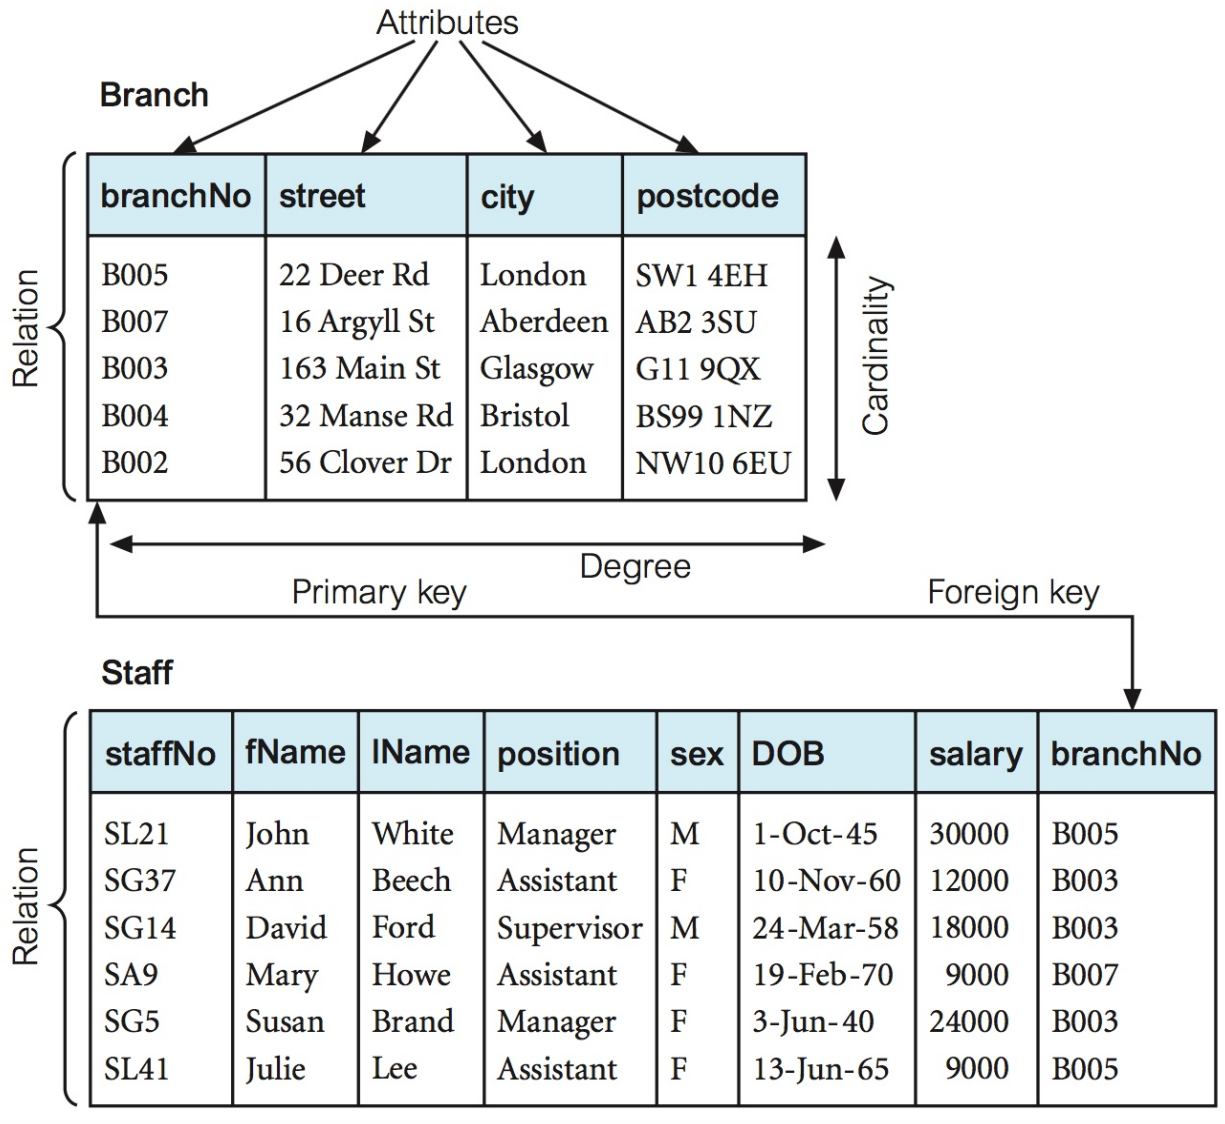
DATABASE RELATIONS

- Relation Schema: A named relation defined by a set of attribute and domain name pairs. schema
- Relational Database Schema: A set of relation schemas, each with a distinct name.

PROPERTIES OF RELATIONS (1)

- The relation has a name that is distinct from all other relation names in the relational schema.
- Each cell of the relation contains exactly one atomic (single) value; n each attribute has a distinct name.
- The values of an attribute are all from the same domain.
- Each tuple is distinct; there are no duplicate tuples.
- The order of attributes has no significance.
- The order of tuples has no significance, theoretically. (However, in practice, the order may affect the efficiency of accessing tuples.)

PROPERTIES OF RELATIONS (2)



RELATIONAL KEYS

- **Super Key:** a column or combination of columns containing unique value for each row.
- **Candidate Key:** a minimal super key. A super key is minimal if removing any column makes it no longer unique.
- **Null Value:** a special value that represents the absence of an actual value. A null value can mean that the actual value is unknown or does not apply to the given row.
- **Primary Key:** a specially designated candidate key. The primary key for a table cannot contain null value.
- **Foreign Key:** a column or combination of columns in which the values must match those of a candidate key. A foreign key must have the same data type as its associated candidate key

INTEGRITY RULES (1)

- **Entity Integrity** means that each table must have a column or combination of columns with unique values. Unique means that no two rows of a table have the same value.
- **Referential Integrity** means that the column values in one table must match column values in a related table.

INTEGRITY RULES (2)

- **Entity Integrity Rule:** No two rows of a table can contain the same value for the primary key. In addition, no row can contain a null value for any column of a primary key.
- **Referential Integrity Rule:** Only two kinds of values can be stored in a foreign key:
  - A value matching a candidate key value in some row of the table containing the associated candidate key.
  - A null value.

RELATIONSHIP

- **Self-Referencing Relationship** is a relationship in which a foreign key refers to the same table. Self-referencing relationships represent associations among members of the same set.
- **1-M Relationship** is a connection between two table in which one row of a parent table can be referenced by many rows of a child table. 1-M relationships are the most common kind of relationship.
- **M-N Relationship** is a connection between two table in which rows of each table can be related to many rows of the other table. M-N relationships cannot be directly represented in the Relationship Model. Two 1-M relationships and a linking or associative table represent an M-N relationship.

JOIN OPERATIONS

- Typically, we want only combinations of the Cartesian product that satisfy certain condi- tions and so we would normally use a Join operation instead of the Cartesian product operation.
- Type of join operations
  - Theta join
  - Equijoin (a particular type of theta join)
  - Natural join
  - Outer join
  - Semi join

EXAMPLE 4 (JOIN)

- List the names and comments of all clients who have viewed a property for rent.

AGGREGATION AND GROUPING OPERATIONS

- As well as simply retrieving certain tuples and attributes of one or more relations, we often want to perform some form of **summation** or **aggregation** of data, similar to the totals at the bottom of a report, or some form of **grouping** of data, similar to subtotals in a report.
- The main aggregation function are:
  - COUNT
  - SUM
  - AVG
  - MIN
  - MAX

EXAMPLE 7 (AGGREGATION)

- How many properties cost more than £350 per month to rent?
- Find the minimum, maximum, and average staff salary.

PropertyForRent

propertyNo	street	city	postcode	type	rooms	rent	ownerNo	staffNo	branchNo

B007	1	9000

TUPLE RELATIONAL CALCULUS

- In the tuple relational calculus we are interested in finding tuples for which a predicate is true.
- The calculus is based on the use of tuple variables.
- A tuple variable is a variable that ‘ranges over’ a named relation: that is, a variable whose only permitted values are tuples of the relation.
- For example:
  - List the names of all managers who earn more than £25,000.
  - List the staff who manage properties for rent in Glasgow.

ASSIGNMENT 1 (1)

- Use the database show in this figure to answer problem.

Table name: EMPLOYEE **Database name: CH2_STORE_CO**
