Rexroth Oil Cleanliness Booklet

Introduction

Oil is the central component of any hydraulic system. If a system fails, contamination is one of the major reasons. This booklet explains the basics of contamination control and serves as a reference and information tool.

04 Need for Hydraulic Filtration

05 Sources of Problems with Fluid Systems

06 Classical Oil Analysis

07 MPC 4614 Mobile Particle Counter

08 Contamination – Types, Origin, Examples

12 Damage Caused By Contamination

13 The Objective

14 Filtration Grade – Particle Sizes

16 Achievable Oil Cleanliness in Accordance with ISO 4406

17 Overview of the Key Filter Properties

18 Fitting Tolerance of Hydraulic Components

19 Recommended Oil cleanliness level

20 Oil Cleanliness Codes in Accordance with ISO 4406

32 Fluid and Product Service

33 Fluidmanagement Products

41 Notes

Need for Hydraulic Filtration

Inspecting contamination in hydraulic systems is a major aspect when designing a filter concept.

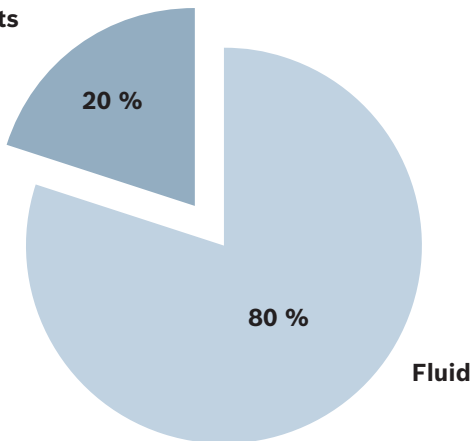

Sources of Problems in Fluid Systems

More than $\frac{3}{4}$ of all problems can be traced back to contaminated oil. Monitoring oil cleanliness is therefore the most important factor in preventing system failures.

Monitoring hardware only detects around 20 % of all unplanned downtimes.

Components

Oil Analysis

Types of inspection for oil cleanliness

- ▶ Offline examination of oil samples in the laboratory
- ▶ Microscopic particle count in accordance with ISO 4407
- ▶ Gravimetric test in accordance with ISO 4405
- ▶ Microscopic determination of the type of contamination

Mobile Particle Counter for Conducting Online Measurements of the Oil Cleanliness Class

- ▶ Light extinction principle
- ▶ Laser sensor
- ▶ Robust and reliable device with all basic functions
- ▶ Integrated battery pack and memory
- ▶ Oil cleanliness classes in accordance with ISO 4406
4 $\mu\text{m(c)}$, 6 $\mu\text{m(c)}$, 14 $\mu\text{m(c)}$
- ▶ Comprehensive range of accessories, e.g. printer, tank pump, external memory card
- ▶ Very easy to use

▲ MPC 4614

▲ Tank pump

▲ Printer

Types of Contamination

1. Solid particles (abrasion and dirt)

Consequences:

- ▶ Initial damage through “scoring”
- ▶ Impact on control and regulation properties
- ▶ Component wear
- ▶ Component failure
- ▶ Reduction in machine availability

Measures: Filtration

2. Liquid contamination (usually water, free and in solution)

Consequences:

- ▶ Corrosion, wear
- ▶ Impairment of viscosity
- ▶ Chem. reaction with the fluid
- ▶ Impact on lubricating properties
- ▶ Ageing (oxidation) of oil
- ▶ Poor filterability
- ▶ Reduction in filter service intervals
- ▶ Reduction in machine availability

Measures:

- ▶ Breather filters with AS filter material
- ▶ Water absorbing filter elements (free)
- ▶ Vacuum dehydrator (water in solution)

3. Gaseous contamination (air)

Consequences:

- ▶ Foam formation in the oil
- ▶ Inaccurate valve response
- ▶ Loss of energy
- ▶ Pump damage
- ▶ Chem. reaction with the fluid
- ▶ Oxidation
- ▶ Reduction in machine availability

Measures:

- ▶ Bleed system
- ▶ Seal pumps
- ▶ Use a vacuum dehydrator

Sources of Contamination

1. Built-in contamination

- ▶ Foundry sand, dust
- ▶ Manufacturing residue:
 - Welding residue
 - Metal swarf
 - Blasting material, lacquer/paint particles
 - Preservation material
- ▶ Residue from cleaning agents (textile fibers)

2. External contamination

- ▶ Dirt from the ambient air, introduced via
 - Plunger rods
 - Labyrinth seals
 - Aeration
- ▶ Contamination caused by adding oil

3. Self-generated contamination

- ▶ Metallic wear caused by abrasion and erosion
- ▶ Seal abrasion
- ▶ Chemical corrosion
- ▶ Oil ageing products
- ▶ Oxidation residue
- ▶ Oil-insoluble substances caused by mixing oil

Examples of residual dirt

Built-in contamination

Residue from a return line filter (mobile hydraulic systems)

- ▶ Welding residue
- ▶ Metal swarf
- ▶ Paint residue
- ▶ Resin

Self-generated contamination (wear)

Residue from a high-pressure filter in a hydraulic system within a stainless steel forging press

- ▶ Coarse brass and steel abrasion particles
- ▶ Severe sliding wear (grooves and stress marks)

Damage Caused By Contamination

Material removal (erosion)

caused by a high flow rate along edges combined with a high number of ingressed dirt particles with high speed in the flow.

Grooving (abrasion)

caused by hard, abrasive particles that are roughly the same size as the clearance of the components.

Consequence: Reduction in performance due to leaking oil.

The Approach

Prevent with Rexroth filter technology.

- ▶ Optimum oil cleanliness
- ▶ Major contribution towards machine availability
- ▶ Reliable component protection
- ▶ High degree of customer satisfaction

- ▶ High degree of oil contamination
- ▶ ISO 22/20/18
- ▶ Achievable oil cleanliness using fine filter elements
- ▶ ISO 12/10/8

Filtration Grade – Particle Sizes

▼ Viruses 0,003 – 0,05 μm

▼ Bacteria 0,3 – 20 μm

▲ Tobacco smoke 0,01 – 1 μm

▲ Blood cells 0,5 – 1,5 μm

▼ Pollen ~ 20 μm

▼ Human hair ~ 70 μm

▲ Visibility limit = 40 μm

Particle sizes are measured in units called “micrometers”.

A micrometer is one millionth of a meter.

The visibility limit of the human eye is approx. 40 μm . This means that particles that are the most hazardous to a hydraulic system cannot be detected with the naked eye.

Achievable Oil Cleanliness in Accordance with ISO 4406

HydroClean XL filter material

H20XL	19/16/12 - 22/17/14
H10XL	17/14/10 - 21/16/13
H6XL	15/12/10 - 19/14/11
H3XL	13/10/8 - 17/13/10
H1XL	10/6/4 - 14/8/6

Achievable oil cleanliness codes can not be guaranteed, as they depend on various application parameters such as ingress rate of contamination, particle size distribution, size, shape and material of particles. Other operating conditions like flow and pressure pulsation will also effect oil cleanliness. Finally oil cleanliness depends on specified filter service intervals. Indicated

oil cleanliness codes in the above table are based on experience and are valid for operating fluids except non-flammable fluids. For these fluids, especially HFA and HFC types, one ISO code higher may appear. Validation of oil cleanliness codes for these fluids is only acceptable for microscopic particle counting.

Overview of the most important filter characteristics

 β_x α Δp

Filtration grade

- ▶ Nominal (from manufacturer)
- ▶ “Absolute” in accordance with ISO 16889
- ▶ Mesh width for wire fabric

Dirt absorption capacity

- ▶ In accordance with ISO 16889
- ▶ ISOMTD test dust

Differential pressure

- ▶ In accordance with ISO 3968
- ▶ In relation to 30 cSt/25 μm

All three properties are mutually interdependent. Rexroth filter elements are characterized by an optimum ratio for these properties, ensuring the best possible filtering action with maximum dirt absorption and minimum Δp .

Fitting Tolerance of Hydraulic Components

Gear pump	0,5 - 5 μm
Gear pump, Side plate Gear housing	0,5 - 5 μm
Vane pump	0,5 - 5 μm
Vane tip Vane surfaces	5 - 13 μm
Piston pump	5 - 40 μm
Piston bore Valve plate cylinder	1,5 - 10 μm
Servo valve	18 - 63 μm
Control piston Baffle plate	2,5 - 8 μm
Control valve	2,5 - 23 μm
Control piston Cone valve	13 - 40 μm

◀ Extract from CETOP RP 92H

Examinations show that even particles with sizes that are $\frac{1}{3}$ x the clearance width can lead to the clearance becoming blocked. The filtration grade of the system filters should therefore be selected in such a way as to ensure the absolute filtration grade is smaller than or equal to $\frac{1}{3}$ of the smallest clearance width in the system.

Filtration grade $\leq \frac{1}{3}$ x smallest clearance

Recommended Oil cleanliness level

Application	Oil cleanliness required in accordance with ISO 4406	Recommended filter material/ filtration grade
Systems with extremely high dirt sensitivity and very high availability requirements	≤ 16/12/9	H1XL / 1 μm
Systems with high dirt sensitivity and high availability requirements, such as servo valve technology	≤ 18/13/10	H3XL / 3 μm
Systems with proportional valves and pressures > 160 bar	≤ 18/14/11	H6XL / 6 μm
Vane pumps, piston pumps, piston engines	≤ 19/16/13	H10XL / 10 μm
Modern industrial hydraulic systems, directional valves, pressure valves	≤ 20/16/13	H10XL / 10 μm
Industrial hydraulic systems with large tolerances and low dirt sensitivity	≤ 21/17/14	H20XL / 20 μm

Oil Cleanliness Codes in Accordance with ISO 4406 and Examples of Contamination

Number of particles (per 100 ml)		ISO- Code
from	to	
1.000.000	2.000.000	21
500.000	1.000.000	20
250.000	500.000	19
130.000	250.000	18
64.000	130.000	17
32.000	64.000	16
16.000	32.000	15
8.000	16.000	14
4.000	8.000	13
2.000	4.000	12
1.000	2.000	11
500	1.000	10
250	500	9
130	250	8
64	130	7
32	64	6
16	32	5

Classification of all particles

$\geq 4 \mu\text{m(c)}$, $\geq 6 \mu\text{m(c)}$ and
 $\geq 14 \mu\text{m(c)}$

Example from ISO 18/16/11:

190.000 particles $\geq 4 \mu\text{m(c)}/100 \text{ ml}$
58.600 particles $\geq 6 \mu\text{m(c)}/100 \text{ ml}$
1.525 particles $\geq 14 \mu\text{m(c)}/100 \text{ ml}$

ISO 4406 counts particles accumulatively, i.e. all particles that are larger than or equal to $4 \mu\text{m}$. In contradiction to this, NAS 1638 counts the particles in differential size classes, i.e. all particles within the range of $5 - 15 \mu\text{m}$, $15 - 25 \mu\text{m}$, etc.

NAS 1638 became INVALID on 05/30/2001!
The replacement standard SAE AS 4059 is a national standard intended for the US aviation industry only. It is therefore no longer permitted to specify contamination classes in accordance with NAS. Specifying contamination in accordance with ISO 4406 on the other hand is considered to be state-of-the-art.

ISO 10/7/5

(NAS 1638: class 1)

200 μm

Particle size

Fluid and Product Service

- ▶ Oil analysis – particles, water content, residual additives
- ▶ Filter element analysis
- ▶ System flushing and decontamination
- ▶ Advice on oil cleanliness and oil maintenance

Extract from the product range

Mobile-Particle-Counter MPC4614

- ▶ Light extinction method
- ▶ Measurement: oil cleanliness
ISO 4406/ SAE AS 4059
4; 6; 14; 21 $\mu\text{m} \pm 0,5$ classes
- ▶ Data memory
- ▶ Installed battery
- ▶ Optional with printer and pump

Datasheet: 51430

Online Particle Monitor OPM II

- ▶ Light extinction method
- ▶ Measurement: oil cleanliness
ISO 4406/ SAE AS 4059E
4; 6; 14; 21 $\mu\text{m} \pm 1$ classes
- ▶ Data memory
- ▶ Programmable alarm contact

Datasheet: 51460

Online Water-Content Measuring Device

- ▶ Application: Online determination of water activity in hydraulic systems and lubricating oil
- ▶ Measurement range: 0 – 100 % of the saturation of water in oil
- ▶ With optional data memory, network or alarm module

VacuClean® Oil Purification VCM 50-2X

- ▶ Operating data: End vacuum up to 50 mbar
- ▶ Oil flow rate: 5 – 50 l/min

Datasheet: 51435

Offline Filter Units (portable, 2- and 4-wheel design)

- ▶ Volume flow: 10, 15, 30, 35, 50, 80 l/min.
- ▶ Filter type: 40 LE 0018, 7 SL 45, 7 SL 130, 40 FLE 0045, 40 FLE 0095, 40 FLE 0120

Filter for Mobile Hydraulics

Datasheet:

- 51426 Type 7SL 30 to 260
- Type 7SLS 90 to 260
- Type 50SL 30 to 80D

Filterelements

- ▶ Typ 1., Typ 2.
- ▶ Size according to DIN 24550
0040 – 1000
Size 0003 – 0270

Datasheet: 51420

Filterelements

- ▶ Typ 9., Typ 10.
- ▶ Replaceable filter elements
of all commercial filter sizes for
the service

Datasheet: 51457

Filterelements

- ▶ Typ 16., Typ 17., Typ 18.
- ▶ Replaceable filter elements for Pall, Eaton and Mahle filter housings

Filterelements

- ▶ Typ 65.
- ▶ Replaceable two stage filter elements for Hydac filter housings (Windmills)

Datasheet: 51461

Filterelemente

- ▶ Typ 73.
- ▶ Two stage filter elements for Rexroth filter housings (Windmills)

Datasheet: 51458

Inline Filter

Datasheet:

- 51401 Type 40 FLEN 0160 to 1000
- 51402 Type 100 FLEN 0160 to 0630
- 51403 Type 16 FE 2500 to 7500
- 51421 Type 245 LEN 0040 to 0400
- 51422 Type 350 LEN 0040 to 1000
- 51423 Type 445 LEN 0040 to 1000
- 51447 Type 50 LEN 0040 to 0400
- 51448 Type 110 LEN 0040 to 0400

Tank Mounted Filter

Datasheet:
