

Safety Essentials

Mandatory requirements for our high risk activities

Leader's Guide

Message from the CEO

The key measure of our success as a business is for our products, assets and operations to be safe for all, which is why the safety of our people, customers and community is our highest priority on every job.

Many of our operations are high risk so we must focus on having the right controls in place to manage all risks, most particularly those that can hurt or kill us.

We first introduced our Safety Essentials fatal risk program in 2014 where we identified activities posing the greatest risk.

We also established three Safety Taskforce teams which focussed on specific areas of risk - safe job planning, contractor management and public safety.

Through this work we've come a long way with our safety controls but we can never be complacent, which is why we have reviewed and refreshed our Safety Essentials.

Responsibility for what happens on our worksites and managing our operations safely sits with us as leaders so it's vital you establish safe systems of work and understand the mandatory requirements for high risk activities set out in this Safety Essentials Leader's Guide.

My principal concern is that every one of our people - and those involved with our operations - goes home safe and well each day. I look forward to working with you to make that a reality.

Donacan

Introduction

Safety Essentials are the mandatory requirements for our high risk activities. Each Safety Essential describes the processes and systems that must be established and maintained to conduct the work safely and minimise the potential for harm.

The mandatory requirements were identified through an extensive program of workshops involving members of our workforce. Safety Essentials does not replace Water Corporation's overall management system for health and safety. Instead it forms an integral part of the system to ensure any operations involving these high risk activities are rigorously managed.

This guide outlines the mandatory system requirements that must be in place to support the management of high risk activities. As a leader, you should use it in conjunction with supporting procedures that relate to each high risk activity.

The requirements set out in this guide apply to all Water Corporation workers, Alliance partners and contractors when working for or on behalf of Water Corporation.

Safe systems of work

As leaders, we must set the right expectations and ensure we have established safe systems of work prior to tasks being allocated.

A safe system of work must consider things like the layout of a workplace (planning), the storage and handling of materials (equipment), the training and competencies of people on site and anything that may affect the progress of your job (change).

By setting our people up for success, we empower them to question whether the appropriate information is available to conduct the work safely:

What can hurt me?

What can kill me?

What controls do I need to put in place?

How do I know they are working?

It is critical as leaders that we have the right conversations with our people to ensure everyone is aware of their role and the mechanisims we all have to keep each other safe.

Remember all work sites are dynamic and have the potential to change. Make sure you empower people to manage these changes.

Continual improvement

At Water Corporation, we are committed to continual improvement. While the requirements set out in this document support current best practice, there are always opportunities to improve. It's incumbent on all of us to explore safer ways of working.

Essential stages of work

We must plan and execute our work safely at Water Corporation. When you're preparing to undertake work it is important that you and your team use the following steps to ensure you are setup for success, controls you rely on are in place and we learn from each other's experience.

Every opportunity has been taken to pre plan, discuss and identify safety and environmental risks.

Proposed controls have been included.

Before work commences review Safe Job Pack on-site.

The Person in Charge must ensure everyone on the job understands:

- their role
- the risks of the job
- why the controls are in place

Start the job.

Where a change is identified, STOP the job, reassess the risk as a team, agree and document controls.

Reassess risk, Team and TL agree on new controls and document.

Every job is an opportunity to learn and a chance to pass on "best practice" knowledge to help others in the future.

- **1.1.** A formal process must be in place to **identify and manage change** that has the potential to increase risk or introduce new hazards to site activities.
- **1.2.** Leaders must be **empowered** to stop the task and positively challenge workers on how they have assessed changes in the work plan.
- **1.3.** Formal consultation and escalation must be included within the managing change process to ensure the right people are involved and included in the approval authority.
- **1.4.** A system that **formally documents and records changes** must be in place that details any design deviations or alterations including formal delegated authority for sign off.
- **1.5.** A system must be in place to identify, track and record the **competency** of supervisors and workers to identify and manage change in the workplace.

- **2.1.** A system to **identify and record** confined spaces must be in place and they must be signposted and have secure entry points.
- **2.2. Training and competencies** for undertaking confined space entry work must be identified, delivered, recorded and maintained.
- **2.3.** A **permit system** must be in place for confined space work, which requires approval from an authorised person.
- **2.4. Communication** methods to monitor the person entering the confined space must be established and maintained for the duration of the entry.
- **2.5. Atmospheric testing and monitoring** equipment must be calibrated, used before and during a confined space entry, and records kept of readings.
- **2.6. Isolation** of services and systems which may potentially discharge into the confined space must be identified and controlled before entering.
- **2.7. Barricading and signage** must be used to prevent unauthorised access by workers and public into the work area.
- **2.8. Emergency response and rescue equipment** must be identified, set up, tested and maintained.

- **3.1. Training, competencies and licences** for undertaking electrical work must be identified, delivered, recorded and maintained.
- **3.2.** Access to electrical assets must be controlled to prevent unauthorised workers or public from gaining entry.
- **3.3.** A **lock out tag out** process must be in place for electrical isolations.
- **3.4.** A system which requires **approval** by a competent person must be in place before the commencing of the task.
- **3.5.** Overhead and underground service voltage, location and minimum distances must be identified and maintained.
- **3.6.** A **testing for de-energisation** process must be in place to verify assets or services have been de-energised before commencing work.
- **3.7.** A **planned maintenance and inspection** schedule must be established, implemented, monitored and recorded for electrical assets and portable electrical equipment.

to release stored energy4.1. Training and competencies must be identified, delivered, recorded and

4.2. Assets or equipment where there is the potential for an uncontrolled release of energy must be **identified** during the planning process.

maintained for undertaking work on assets and equipment.

- **4.3.** The **planning process** must identify hazards associated with uncontrolled release of energy to prevent people from being in the line of fire.
- **4.4.** A **lock out tag out** process must be in place for assets where there is the potential for an uncontrolled release of energy.
- **4.5.** A planned **maintenance and inspection schedule** must be established, implemented, monitored and recorded for assets.

- **5.1. Training and competencies** for undertaking excavation work must be identified, delivered, recorded and maintained.
- **5.2. Potential contaminants** that could create an unsafe atmosphere must be identified and controlled.
- **5.3.** A system which requires **approval** by a competent person must be in place before the commencing of the task.
- **5.4. Overhead and underground service** location and minimum distances must be identified and maintained.
- **5.5.** Methods of **preventing a collapse** must be in place for excavations, and where deeper than 1.5 m, this must be approved by a competent person.
- **5.6.** Access and egress methods for entering and exiting excavations must be identified and made available.
- **5.7. Barricading and signage** must be used to prevent unauthorised access by workers and public into the work area.
- **5.8.** An **inspection** process must be in place to ensure excavation stability is maintained, and undertaken and documented by a competent person.
- **5.9. Emergency response and rescue equipment** must be identified, set up, tested and maintained.

- **6.1. Training, competencies and licences** for work that involves exposure to potential falls must be identified, delivered, recorded and maintained.
- **6.2.** A process for **selecting** equipment to prevent a fall must be established and aligned with the hierarchy of controls.
- **6.3. Barricading and signage** must be available to prevent unauthorised access by workers and public into the work area.
- **6.4.** A planned **maintenance and inspection** schedule must be established, implemented, monitored and recorded for assets and equipment.
- **6.5. Emergency response and rescue equipment** must be identified, set up, tested and maintained.

Working with or near hazardous substances and dangerous goods

- **Training and competencies** for workers who handle, transport or 7.1. use hazardous materials must be identified, delivered, recorded and maintained.
- 7.2. Hazardous materials are **risk assessed** and controls must be implemented prior to purchase, storage or use on site.
- 7.3. Signage and labels must be in place where hazardous materials are located and on the containers they are stored in.
- A process must be in place to **identify** and register asbestos containing 7.4. materials.
- Safety data sheets must be available and current for hazardous 7.5. materials.
- 7.6. **Emergency response and rescue equipment** must be identified, set up, tested and maintained.
- Where potentially **exposed** to hazardous materials, a process must 7.7. be in place to record the potential exposure and monitor the health of workers.

11

- **8.1. Training, competencies and licences** for lifting must be identified, delivered, recorded and maintained.
- **8.2.** Equipment, devices and accessories **selected** for a lift must be fit for purpose.
- **8.3.** A process to **determine** the complexity of a lift must be established, documented and approved by a competent person.
- **8.4. Barricading and signage** must be available to prevent unauthorised access by workers and public into the work area.
- **8.5.** Communication methods must be established and maintained for the duration of the lift.
- **8.6.** Loads must be **secured** before lifting and controls implemented to prevent workers from walking under a load or being in the line of fire.
- **8.7.** A planned **maintenance and inspection** schedule must be established, implemented, monitored and recorded for lifting equipment, devices and accessories.

Operating or working

near mobile plant

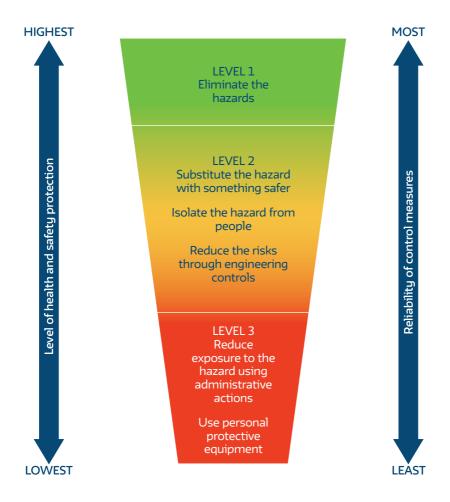

- **9.1. Training, competencies and licences** for operating mobile plant must be identified, delivered, recorded and maintained.
- **9.2.** A **risk assessment** process must be in place for the purchase, storage, registration and use of mobile plant, and to ensure the plant is suitable for the task.
- **9.3. Barricading and signage** must be available to prevent unauthorised access by workers and public into the work area.
- **9.4. Communication** methods must be established and maintained while operating plant.
- **9.5.** A planned **maintenance and inspection** schedule must be established, implemented, monitored and recorded for mobile plant.

- **10.1.** Licences, including training and competency requirements for driving vehicles and trucks must be identified, delivered, recorded and maintained.
- **10.2.** Vehicle and truck **selection** must assess suitability of the vehicle or truck for the application, operating requirement, use, location and driver competencies.
- **10.3.** A journey **planning** process must be in place to identify, plan, document and manage high risk journeys.
- **10.4.** Cargo/load restraint must be in place when transporting goods.
- **10.5.** A method of **separating** people from vehicles and trucks must be established, communicated and maintained.
- **10.6.** A planned **maintenance and inspection** schedule must be established, implemented, monitored and recorded for vehicles and trucks.
- **10.7.** A system must be in place to provide **driver feedback** and identify and reward good driving, and improve unsafe driving.

Hierarchy of Control

Every effort must be made to eliminate or minimise your exposure to hazards. When identifying hazards, you must follow the hierarchy of control when selecting controls and ask yourself – "Is there a safer way?"

Definitions

Term	Description
Competent Person	A person who has, through a combination of training, education and experience, acquired knowledge and skills enabling that person to perform a specified task safely and correctly in accordance with Water Corporation's Standards and Procedures and Legislative requirements.
Must	Understood as mandatory, non-negotiable requirement that is to be followed. There will be no deviation from this requirement.
Operating	To work or use a machine, apparatus, or piece of equipment.
Worker	A person who carries out work in any capacity for or on behalf of the Water Corporation. A worker agrees to perform work at Water Corporation's direction, instruction or request (whether express, implied, oral or in writing). This includes employees, contractors, subcontractors, employees of contractors and subcontractors, labour hire employees, apprentices and trainees, work experience students, outworkers or volunteers.
Working in	When a person is positioned within a physical space (e.g. within a confined space or within an excavation).
Working near	When a person is positioned close enough to a task that they could be harmed by the hazards associated with that task (e.g. lifts or mobile plant).
Working on	When a person is physically working on a task (e.g. Electrical work - work on electrical machines or instruments; electrical installation; electrical appliances or equipment; or assessment of electrical compliance).
Working with	When a person is working with a hazard that has the potential to cause harm (e.g. Potential of exposure to hazardous substance or potential of exposure to an uncontrolled release of energy).

Notes			
		 	······

Can I eliminate the hazard?

Are the necessary controls in place?

Have I communicated the controls to others and do they understand them?

Have I stopped and reassessed a task that's changed?

If you have any concerns, stop and contact your supervisor.
