

## Scientific Notation and Conversion Factors

---

---

---

---

---

---

---

---

## Chemistry Numbers

Numbers in chemistry are often very small or very large!

For example,  
602300000000000000000000  
= 1 mole

---

---

---

---

---

---

---

---

## Scientific Notation

We can make numbers easier to work with by writing them in **scientific notation**

602300000000000000000000  
=  $6.02 \times 10^{23}$

---

---

---

---

---

---

---

---

## Scientific Notation

Convert numbers  $> 1$  to scientific notation by moving the decimal to after the 1<sup>st</sup> digit.

$$\begin{array}{cccccccc} 6 & 5 & 0 & 0 & 0 & 0 & 0 & 0 \\ 7 & 6 & 5 & 4 & 3 & 2 & 1 & \end{array}$$

↓

$$6.5 \times 10^7$$

The **exponent** represents the number of **digits the decimal was moved** – it will be positive for numbers  $> 1$

---

---

---

---

---

---

---

---

---

---

## Scientific Notation

Convert numbers  $< 1$  to scientific notation by moving the decimal to after the 1<sup>st</sup> nonzero digit.

$$\begin{array}{ccccccc} . & 0 & 0 & 0 & 0 & 9 & 8 & 7 \\ -1 & -2 & -3 & -4 & -5 & & & \end{array}$$

↓

$$9.87 \times 10^{-5}$$

The **exponent** represents the number of **digits the decimal was moved** – it will be negative for numbers  $< 1$

---

---

---

---

---

---

---

---

---

---

## Practice!

Rewrite the following numbers in scientific notation.

435,800	<b><math>4.358 \times 10^5</math></b>
0.000249	<b><math>2.49 \times 10^{-4}</math></b>
0.243	<b><math>2.43 \times 10^{-1}</math></b>
3,479,209,400	<b><math>3.4792094 \times 10^9</math></b>

---

---

---

---

---

---

---

---

---

---

## Standard Notation

When a number is written the usual way it is called **standard notation**

---

---

---

---

---

---

---

---

## Standard Notation

Convert numbers  $> 1$  (**positive exponent**) to standard notation by moving the decimal to **right** however many digits are equal to the exponent.

$$6.5 \times 10^7 = \underset{\substack{1 \ 2 \ 3 \ 4 \ 5 \ 6 \ 7 \\ \longrightarrow}}{65000000.}$$

---

---

---

---

---

---

---

---

## Standard Notation

Convert numbers  $< 1$  (**negative exponent**) to standard notation by moving the decimal to **left** however many digits are equal to the exponent.

$$9.87 \times 10^{-5} = \overset{\substack{5 \ 4 \ 3 \ 2 \ 1 \\ \longleftarrow}}{.0000987}$$

---

---

---

---

---

---

---

---

## Practice!

Rewrite the following numbers in standard notation.

$$4.56 \times 10^{-3} \quad \mathbf{0.00456}$$

$$9.234 \times 10^7 \quad \mathbf{92,340,000}$$

$$7.233 \times 10^3 \quad \mathbf{7233}$$

$$3.9 \times 10^{-6} \quad \mathbf{0.0000039}$$

---

---

---

---

---

---

---

---

## Calculator

Numbers in scientific notation **MUST** be entered into the calculator using the EE key as follows:

Ex.  $6.02 \times 10^{23}$

6.02 2<sup>nd</sup> EE 23

2<sup>nd</sup> Function Key

---

---

---

---

---

---

---

---

## Sig Figs

All of the digits in a number written in scientific notation are significant (Ignore the "x 10<sup>x</sup>" part!)

$$5.30 \times 10^3$$

3sf

$$5.5 \times 10^{-7}$$

2sf

---

---

---

---

---

---

---

---

# Units

Units behave like variables in algebra!

$$\frac{x \cdot y}{x} = y \quad \frac{\text{milligrams} \cdot \text{grams}}{\text{milligrams}} = \text{grams}$$

$$\frac{x \cdot x}{y \cdot y} = \frac{x^2}{y^2} \quad \frac{\text{grams} \cdot \text{grams}}{\text{milligrams} \cdot \text{milligrams}} = \frac{\text{grams}^2}{\text{milligrams}^2}$$

---

---

---

---

---

---

---

---

# Practice!

Simplify the following expressions:

$$\frac{\text{mL} \cdot \text{L}}{\text{mL}} = \text{L}$$

$$\frac{\text{g} \cdot \text{kg}}{\text{kg}} = \text{g}$$

---

---

---

---

---

---

---

---

# Calculating w/ Units

To make things easier, can write the expression

$$\frac{\text{milligrams} \cdot \text{grams}}{\text{milligrams}} = \text{grams}$$

like this,

$$\frac{\text{milligrams}}{\text{milligrams}} \cdot \text{grams} = \text{grams}$$

multiply

divide

---

---

---

---

---

---

---

---

## Conversion Factors

When two quantities are set equal to one another, the expression is called a **conversion factor**.

$$1 \text{ dozen} = 12 \text{ eggs}$$

Conversion factors are used to convert the units of one quantity to another.

---

---

---

---

---

---

---

---

## Conversion Factors

All conversion factors can be written as two equivalent ratios.

$$1 \text{ dozen} = 12 \text{ eggs}$$

$$\frac{1 \text{ dozen}}{12 \text{ eggs}} \quad \text{or} \quad \frac{12 \text{ eggs}}{1 \text{ dozen}}$$

---

---

---

---

---

---

---

---

## Conversion Factors

To convert the units of a number, multiply it with a conversion factor.

Ex. Convert 9 eggs to dozens

$$6 \text{ eggs} \times \frac{1 \text{ dozen}}{12 \text{ eggs}} = 0.5 \text{ dozen}$$

Conversion Factor

---

---

---

---

---

---

---

---

## Conversion Factors

Always select a conversion factor which has the unit of the given substance on the bottom.

$$\frac{6 \text{ eggs}}{1 \text{ dozen}} \times \frac{1 \text{ dozen}}{12 \text{ eggs}} = 0.5 \text{ dozen}$$

Given Substance

The given unit cancels out!

---

---

---

---

---

---

---

---

## Practice!

Pick the correct conversion factor to use for the following calculations.

$$\frac{1000 \text{ g}}{1 \text{ kg}} \quad \frac{1 \text{ kg}}{1000 \text{ g}} \quad \frac{1000 \text{ mL}}{1 \text{ L}} \quad \frac{1 \text{ L}}{1000 \text{ mL}}$$

$$6.0 \text{ g} \left[ \frac{\quad}{\quad} \right] = \text{kg} \quad \frac{1 \text{ kg}}{1000 \text{ g}}$$

$$2.0 \text{ mL} \left[ \frac{\quad}{\quad} \right] = \text{L} \quad \frac{1 \text{ L}}{1000 \text{ mL}}$$

---

---

---

---

---

---

---

---

## Sig Figs!

Conversion factors are not used to determine the number of sig figs in the answer!

$$\frac{2.34 \text{ g}}{1000 \text{ g}} \times \frac{1 \text{ kg}}{1000 \text{ g}} = 0.00234 \text{ kg}$$

not used  
3 sf  
not used  
Conversion Factor  
3 sf

---

---

---

---

---

---

---

---

## Practice!

Perform the following calculations. Round the answers to the proper number of sig figs.

$$\frac{3.56 \text{ ml}}{1000 \text{ ml}} \times 1 \text{ L} = \overset{3 \text{ sf}}{0.00356} \text{ L}$$

$$\frac{4.567 \text{ g}}{1 \text{ g}} \times 1000 \text{ mg} = \overset{4 \text{ sf}}{4567} \text{ mg}$$

---

---

---

---

---

---

---

---

## Finished!

---
