# Sequences and Summations

Section 2.4

# Introduction

- Sequences are ordered lists of elements.
  - 1, 2, 3, 5, 8
  - 1, 3, 9, 27, 81, .....
- Sequences arise throughout mathematics, computer science, and in many other disciplines, ranging from botany to music.
- We will introduce the terminology to represent sequences and sums of the terms in the sequences.

# Sequences

- **Definition**: A *sequence* is a function from a subset of the integers (usually either the set  $\{0, 1, 2, 3, 4, ....\}$  or  $\{1, 2, 3, 4, ....\}$ ) to a set *S*.
- The notation a<sub>n</sub> is used to denote the image of the integer *n*. We can think of a<sub>n</sub> as the equivalent of *f*(*n*) where *f* is a function from {0,1,2,....} to *S*. We call a<sub>n</sub> a *term* of the sequence.

# Sequences

**Example**: Consider the sequence  $\{a_n\}$  where

$$a_n = \frac{1}{n}$$
  $\{a_n\} = \{a_1, a_2, a_3, \ldots\}$ 

$$1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4} \dots$$

# **Geometric Progression**

**Definition**: A *geometric progression* is a sequence of the form:  $a, ar, ar^2, \ldots, ar^n, \ldots$ 

where the *initial term a* and the *common ratio r* are real numbers.

#### **Examples**:

1. Let 
$$a = 1$$
 and  $r = -1$ . Then:  
 $\{b_n\} = \{b_0, b_1, b_2, b_3, b_4, \dots\} = \{1, -1, 1, -1, 1, \dots\}$ 

2. Let a = 2 and r = 5. Then:

$$\{c_n\} = \{c_0, c_1, c_2, c_3, c_4, \dots\} = \{2, 10, 50, 250, 1250, \dots\}$$

3. Let a = 6 and r = 1/3. Then:  $\{d_n\} = \{d_0, d_1, d_2, d_3, d_4, \dots\} = \{6, 2, \frac{2}{3}, \frac{2}{9}, \frac{2}{27}, \dots\}$ 

#### Summation of Geometric Sequence $a, ar, ar^2, \ldots, ar^n, \ldots$

- Given a sequence
  - Term  $a_n = a r^{n-1}$ ,  $a_1 = a$ .
  - Let  $S_n = a_1 + a_2 + a_3 + \ldots + a_{n-1} + a_n$
  - Then what is a closed formula for S<sub>n</sub>?
  - Tricks:
    - $S_n = a_1 + a_2 + a_3 + \dots + a_{n-1} + a_n = a + a r + a r^2 + a r^3 \dots + a r^{n-1}$
    - $S_{n+1} = a_1 + a_2 + a_3 + \dots + a_{n-1} + a_n + a_{n+1} = a + a r + a r^2 + a r^3 \dots + a r^{n-1} + a r^n$
    - $S_{n+1} = S_n + a_{n+1} = S_n + a r^n$
    - $S_{n+1} = a + a r + a r^2 + a r^3 \dots + a r^{n-1} + a r^n = a + r(a + a r + a r^2 \dots + a r^{n-2} + a r^{n-1}) = a + rS_n$
    - So, we have  $S_n + a r^n = a + rS_n$
    - Thus  $S_n = (a a r^n) / (1 r)$  when r is not 1

# **Arithmetic Progression**

**Definition**: A *arithmetic progression* is a sequence of the form: a, a + d, a + 2d, ..., a + nd, ...

where the *initial term a* and the *common difference d* are real numbers.

#### **Examples**:

1. Let 
$$a = -1$$
 and  $d = 4$ :  
 $\{s_n\} = \{s_0, s_1, s_2, s_3, s_4, \dots\} = \{-1, 3, 7, 11, 15, \dots\}$ 

2. Let 
$$a = 7$$
 and  $d = -3$ :  
 $\{t_n\} = \{t_0, t_1, t_2, t_3, t_4, \dots\} = \{7, 4, 1, -2, -5, \dots\}$ 

3. Let 
$$a = 1$$
 and  $d = 2$ :  
 $\{u_n\} = \{u_0, u_1, u_2, u_3, u_4, \dots\} = \{1, 3, 5, 7, 9, \dots\}$ 

# Strings

- **Definition**: A *string* is a finite sequence of characters from a finite set (an alphabet).
- Sequences of characters or bits are important in computer science.
- The *empty string* is represented by  $\lambda$ .
- The string *abcde* has *length* 5.

# **Recurrence Relations**

- **Definition:** A *recurrence relation* for the sequence  $\{a_n\}$  is an equation that expresses  $a_n$  in terms of one or more of the previous terms of the sequence, namely,  $a_0, a_1, \ldots, a_{n-1}$ , for all integers n with  $n \ge n_0$ , where  $n_0$  is a nonnegative integer.
- A sequence is called a *solution* of a recurrence relation if its terms satisfy the recurrence relation.
- The *initial conditions* for a sequence specify the terms that precede the first term where the recurrence relation takes effect.

#### Questions about Recurrence Relations

**Example** 1: Let  $\{a_n\}$  be a sequence that satisfies the recurrence relation  $a_n = a_{n-1} + 3$  for n = 1,2,3,4,... and suppose that  $a_0 = 2$ . What are  $a_1$ ,  $a_2$  and  $a_3$ ? [Here  $a_0 = 2$  is the initial condition.]

**Solution**: We see from the recurrence relation that

$$a_1 = a_0 + 3 = 2 + 3 = 5$$
  
 $a_2 = 5 + 3 = 8$   
 $a_3 = 8 + 3 = 11$ 

#### Questions about Recurrence Relations

**Example** 2: Let  $\{a_n\}$  be a sequence that satisfies the recurrence relation  $a_n = a_{n-1} - a_{n-2}$  for n = 2,3,4,... and suppose that  $a_0 = 3$  and  $a_1 = 5$ . What are  $a_2$  and  $a_3$ ? [Here the initial conditions are  $a_0 = 3$  and  $a_1 = 5$ .]

Solution: We see from the recurrence relation that

$$a_2 = a_1 - a_0 = 5 - 3 = 2$$
$$a_3 = a_2 - a_1 = 2 - 5 = -3$$

# Fibonacci Sequence

**Definition**: Define the *Fibonacci sequence*,  $f_0$ ,  $f_1$ ,  $f_2$ , ..., by:

- Initial Conditions:  $f_0 = 0, f_1 = 1$
- Recurrence Relation:  $f_n = f_{n-1} + f_{n-2}$

**Example:** Find  $f_2, f_3, f_4, f_5$  and  $f_6$ .

#### **Answer:**

$$\begin{split} f_2 &= f_1 + f_0 = 1 + 0 = 1, \\ f_3 &= f_2 + f_1 = 1 + 1 = 2, \\ f_4 &= f_3 + f_2 = 2 + 1 = 3, \\ f_5 &= f_4 + f_3 = 3 + 2 = 5, \\ f_6 &= f_5 + f_4 = 5 + 3 = 8. \end{split}$$

# Solving Recurrence Relations

- Finding a formula for the *n*th term of the sequence generated by a recurrence relation is called *solving the recurrence relation*.
- Such a formula is called a *closed formula*.
- Various methods for solving recurrence relations will be covered in Chapter 8 where recurrence relations will be studied in greater depth.
- Here we illustrate by example the method of iteration in which we need to guess the formula. The guess can be proved correct by the method of induction (Chapter 5).

# **Iterative Solution Example**

Method 1: Working upward, forward substitution Let  $\{a_n\}$  be a sequence that satisfies the recurrence relation  $a_n = a_{n-1} + 3$  for n = 2,3,4,... and suppose that  $a_1 = 2$ .  $a_2 = 2 + 3$  $a_3 = (2+3) + 3 = 2 + 3 \cdot 2$  $a_{4} = (2 + 2 \cdot 3) + 3 = 2 + 3 \cdot 3$  $a_n = a_{n-1} + 3 = (2 + 3 \cdot (n - 2)) + 3 = 2 + 3(n - 1)$ 

## **Iterative Solution Example**

**Method** 2: Working downward, backward substitution Let  $\{a_n\}$  be a sequence that satisfies the recurrence relation  $a_n = a_{n-1} + 3$  for n = 2,3,4,... and suppose that  $a_1 = 2$ .

$$a_{n} = a_{n-1} + 3$$
  
=  $(a_{n-2} + 3) + 3 = a_{n-2} + 3 \cdot 2$   
=  $(a_{n-3} + 3) + 3 \cdot 2 = a_{n-3} + 3 \cdot 3$   
.

.

# **Financial Application**

- **Example**: Suppose that a person deposits \$10,000.00 in a savings account at a bank yielding 11% per year with interest compounded annually. How much will be in the account after 30 years?
- Let  $P_n$  denote the amount in the account after 30 years.  $P_n$  satisfies the following recurrence relation:

$$P_n = P_{n-1} + 0.11P_{n-1} = (1.11) P_{n-1}$$

with the initial condition  $P_0 = 10,000$ 

Continued on next slide  $\rightarrow$ 

# **Financial Application**

 $P_n = P_{n-1} + 0.11P_{n-1} = (1.11) P_{n-1}$ 

with the initial condition  $P_0 = 10,000$ 

Solution: Forward Substitution

$$\begin{split} P_1 &= (1.11)P_0 \\ P_2 &= (1.11)P_1 = (1.11)^2 P_0 \\ P_3 &= (1.11)P_2 = (1.11)^3 P_0 \\ &\vdots \\ P_n &= (1.11)P_{n-1} = (1.11)^n P_0 = (1.11)^n \ 10,000 \\ P_n &= (1.11)^n \ 10,000 \ \text{(Can prove by induction, covered in Chapter 5)} \\ P_{30} &= (1.11)^{30} \ 10,000 = \$228,992.97 \end{split}$$

# **Useful Sequences**

TABLE 1 Some Useful Sequences.		
nth Term First 10 Terms		
$n^2$ 1, 4, 9, 16, 25, 36, 49, 64, 81, 100,		
$n^3$	1, 8, 27, 64, 125, 216, 343, 512, 729, 1000,	
$n^4$ 1, 16, 81, 256, 625, 1296, 2401, 4096, 6561, 10000,		
$2^n$	2, 4, 8, 16, 32, 64, 128, 256, 512, 1024,	
$3^n$	3, 9, 27, 81, 243, 729, 2187, 6561, 19683, 59049,	
<i>n</i> !	1, 2, 6, 24, 120, 720, 5040, 40320, 362880, 3628800,	
$f_n$	1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89,	

# Summations

- Sum of the terms  $a_m, a_{m+1}, \dots, a_n$ from the sequence  $\{a_n\}$
- The notation:

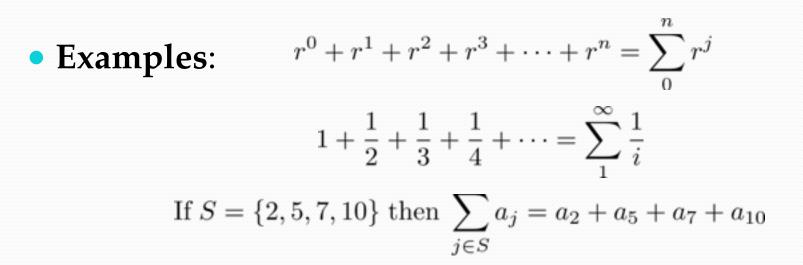

$$\sum_{j=m}^{n} a_j \quad \sum_{j=m}^{n} a_j \quad \sum_{m \le j \le n} a_j$$

represents  $a_m + a_{m+1} + \dots + a_n$ 

• The variable *j* is called the *index of summation*. It runs through all the integers starting with its *lower limit m* and ending with its *upper limit n*.

### Summations

### • More generally for a set *S*: $\sum_{j \in S} a_j$

# Product Notation (optional)

• Product of the terms  $a_m, a_{m+1}, \dots, a_n$ from the sequence  $\{a_n\}$ 

• The notation:  

$$\prod_{j=m}^{n} a_j \qquad \prod_{j=m}^{n} a_j \qquad \prod_{m \le j \le n}^{m} a_j$$

represents  $a_m \times a_{m+1} \times \cdots \times a_n$ 

### **Geometric Series**

Sums of terms of geometric progressions

$$\sum_{j=0}^{n} ar^{j} = \begin{cases} \frac{ar^{n+1}-a}{r-1} & r \neq 1\\ (n+1)a & r = 1 \end{cases}$$

**Proof:** 

Let

$$S_n = \sum_{j=0}^n ar^j$$
$$rS_n = r \sum_{j=0}^n ar^j$$
$$= \sum_{j=0}^n ar^{j+1}$$

To compute  $S_n$ , first multiply both sides of the equality by r and then manipulate the resulting sum as follows:

Continued on next slide  $\rightarrow$ 

### **Geometric Series**

 $= \sum_{j=0}^{n} ar^{j+1}$  From previous slide.  $= \sum_{k=1}^{n+1} ar^{k}$  Shifting the index of summation with k = j + 1.  $= \left(\sum_{k=0}^{n} ar^{k}\right) + (ar^{n+1} - a)$  Removing k = n + 1 term and adding k = 0 term.

 $= S_n + (ar^{n+1} - a)$  Substituting *S* for summation formula

$$rS_n = S_n + (ar^{n+1} - a)$$

$$S_n = \frac{ar^{n+1} - a}{r - 1} \quad \text{if } r \neq 1$$
$$S_n = \sum_{j=0}^n ar^j = \sum_{j=0}^n a = (n+1)a \quad \text{if } r = 1$$

### Some Useful Summation Formulae

TABLE 2 Some Useful Summation Formulae.		
Sum	Closed Form	Geometric Series: We
$\sum_{k=0}^{n} ar^k \ (r \neq 0)$	$\frac{ar^{n+1}-a}{r-1}, r \neq 1$	just proved this.
$\sum_{k=0}^{n} k$	n(n+1)	← Later we
$\sum_{k=1}^{k}$	2	will prove
$\sum_{k=1}^{n} k^2$	$\frac{n(n+1)(2n+1)}{6}$	some of
k = 1 n	0	these by
$\sum_{k=1}^{\infty} k^3$	$\frac{n^2(n+1)^2}{4}$	induction.
$\sum_{k=0}^{\infty} x^k,  x  < 1$	$\frac{1}{1-x}$	Proof in text
$\sum_{k=0}^{\infty} kx^{k-1},  x  < 1$	1	(requires calculus)
$\sum_{k=1}^{kx^{n-1}}  x  < 1$	$\overline{(1-x)^2}$
