Chapter 2-3

## Short Run SPC

## Consider the Following

- Low production quantity
- One process produces many different items
- Different operators use the same equipment

> These are all what we refer to as short run situations and suggest the use of the short run SPC methodology.

Many firms have decided to use smaller production runs or shoftuluze runs in their mixed-model production processes to provide greater flexibility in meeting customer demand, improve quality, and reduce unnecessary waste in their production systems (Porteus 1986). Unfortunately, the volatility in lot size and variety of products produced caused by a change to short-runs and mixed-model methods can necessitate other production processes to change. One case in point is the Shewhart Statistical Process Control (SPC) system. Traditionally, Shewhart's SPC techniques are applied in high-volume and repetitive manufacturing systems. The Shewhart SPC methodology is directed at signaling special causes of variation generated during a production run. Such signals are detected using control limits constructed on the basis of within-subgroup variability, measured after the process has been set up, adjusted, and brought into statistical control. In other words, "the process" to be monitored is that which exists after setup and adjustment. However, in a short-run production that is characterized by frequent setups of small production runs, SPC must be applied differently. SPC must incorporate a broader definition of the process, which recognizes ongoing volatility in the sequences of setups and production runs.

## From American Journal of Business

## Short Run SPC Approaches

- Nominal Short Run SPC
- Target Short Run SPC
- Short Run Short Run SPC

These work for variables

- These work for attributes
- We will look at the applications for averages and ranges

## Nominal Short Run X Bar and R Chart

The nominal x bar and R chart is used to monitor the behavior of a process running different part numbers and still retain the ability to assess control.

This is done by coding the actual measured readings in a subgroup as a variation from a common reference point, in this case the nominal print specification.

## Nominal X Bar and R Chart

The nominal value becomes the zero point on the x bar control chart scale.

## Nominal X Bar and R ChartConstructing the Chart

## Nominal X Bar and R ChartConstructing the Chart

Continue for each subgroup for that part.

Repeat the process when the part number changes.
(When constructing the graph use a dotted line when part numbers change.)

Continue until a minimum of 20 subgroups have been measured.

Calculate the average range.

Calculate the average of the nominal x bar chart using the coded values.

## Nominal X Bar and R Chart—

## Variation Check

The use of this method assumes the process variation of all part numbers is approximately equal. If one is too large compared to the rest, it cannot be plotted on the same nominal chart.

- Compare the average range for each part ( $\mathrm{R}_{\mathrm{s}}$ ) with the overall average range for all of the parts.
- If the ratio of $R_{s}$ to the total, $R_{\text {total }}$ is greater than 1.3 or less than .77 the part cannot be plotted on the same nominal chart.

## Nominal X Bar and R ChartControl Limit Formulas

$$
\begin{array}{ll}
U C L \bar{x}=\bar{x}+A_{2} \bar{R} & \text { - Draw the chart } \\
L C L \bar{x}=\bar{x}-A_{2} \bar{R} & \text { - Analyze the variation }
\end{array}
$$

$U C L R=D_{4} \bar{R}$
$L C L R=D_{3} \bar{R}$

## Nominal X Bar and R Chart— Additional Restrictions

## Example

- The table on the following page shows data for four different parts run on the same machine for the same characteristic.
- The table on the page following that shows some sample data collected.
- Calculate the nominal x bar and R chart control limits.

## Information for Example

| Part | Nominal |
| :---: | :---: |
| A | 40 |
| B | 20 |
| C | 60 |
| D | 10 |

All parts are to be within $\pm 5$ units of nominal.

| Product | Sample 1 | Sample 2 | Sample 3 | Sample 4 | Sample 5 | Sample 6 | $6 \sigma$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | 38.5 | 39.0 | 39.5 | 40.0 | 40.5 | 410 | ANALYZE |
| A | 40.5 | 41.0 | 41.5 | 41.5 | 42.5 | 43.0 |  |
| A | 39.5 | 40.5 | 40.5 | 41.0 | 43.5 | 43.0 |  |
| A | 38.0 | 37.1 | 37.5 | 41.5 | 42.0 | 42.5 |  |
| B | 19.5 | 19.8 | 20.0 | 20.3 | 20.5 | 20.8 |  |
| B | 17.0 | 22.3 | 21.3 | 19.0 | 19.3 | 19.5 |  |
| B | 18.3 | 18.5 | 18.8 | 23.0 | 23.3 | 23.5 |  |
| B | 19.3 | 19.5 | 19.8 | 20.0 | 20.3 | 20.5 |  |
| C | 58.3 | 57.7 | 57.8 | 62.3 | 61.1 | 60.8 |  |
| C | 57.8 | 58.5 | 59.3 | 60.0 | 60.8 | 61.5 |  |
| C | 63.0 | 59.0 | 60.0 | 60.0 | 60.4 | 60.6 |  |
| D | 9.8 | 12.2 | 10.1 | 10.0 | 10.1 | 8.9 |  |
| D | 12.2 | 10.0 | 10.1 | 9.2 | 10.0 | 9.9 |  |
| D | 10.7 | 9.0 | 8.0 | 10.1 | 10.1 | 9.8 |  |
| D | 8.7 | 10.2 | 11.2 | 9.7 | 9.9 | 10.0 |  |
| A | 39.5 | 40.0 | 40.5 | 41.0 | 43.0 | 42.5 |  |
| A | 44.0 | 41.5 | 41.5 | 43.0 | 43.0 | 42.0 |  |
| C | 58.3 | 57.0 | 57.8 | 58.5 | 59.3 | 61.0 |  |
| c | 60.0 | 62.3 | 63.0 | 63.8 | 59.0 | 62.0 |  |
| B | 18.3 | 18.5 | 18.8 | 19.0 | 18.5 | 22.0 |  |
| B | 19.5 | 19.8 | 20.0 | 20.3 | 20.5 | 20.0 |  |
| B | 19.5 | 20.0 | 20.0 | 20.3 | 20.5 | 21.5 |  |
| D | 8.0 | 10.9 | 10.1 | 9.8 | 9.8 | 9.9 |  |
| D | 10.2 | 12.0 | 10.0 | 9.8 | 10.0 | 9.9 |  |
| A | 36.5 | 37.0 | 37.5 | 38.0 | 41.3 | 41.0 |  |
| A | 41.0 | 39.6 | 40.0 | 39.1 | 38.9 | 42.0 |  |
| B | 19.0 | 19.3 | 21.0 | 22.0 | 21.8 | 22.3 |  |
| B | 18.5 | 19.5 | 20.5 | 21.5 | 20.8 | 18.6 |  |
| C | 61.4 | 59.6 | 61.7 | 58.1 | 62.2 | 60.0 |  |
| C | 59.2 | 57.0 | 61.5 | 59.3 | 57.8 | 60.0 | 2-3-14 |

## Nominal X Bar and R ChartExample Calculations

$$
\begin{aligned}
& U C L \bar{x}=\overline{=}+A_{2} \bar{R} \\
& L C L \bar{x}=\overline{\bar{x}}-A_{2} \bar{R} \\
& U C L R=D_{4} \bar{R} \\
& L C L R=D_{3} \bar{R}
\end{aligned}
$$

## Target X Bar and R Chart

There is a unilateral spec, either max or min but not both

## In That Case...

> Use the historical process average of a part number as the target process mean and measure the variation of future pieces from this target.
> Use the following formulas for control limits.

## Target Chart Formulas

$$
\begin{aligned}
& U C L \bar{x}=\overline{\bar{x}}+A_{2} \bar{R} \\
& L C L \bar{x}=\bar{x}-A_{2} \bar{R} \\
& U C L R=D_{4} \bar{R} \\
& L C L R=D_{3} \bar{R}
\end{aligned}
$$

## Historical Average or Nominal?

Use the nominal unless the absolute value of the difference between the nominal and historical value is greater than the critical value of $f_{1}$ times the sample standard deviation.

If $\mid$ Nominal - Historical Average $\mid \leq f_{1} \mathrm{~s}$ then use Nominal

Values of $f_{1}$ are on the next page.

## Values of $f_{1}$

| Number of <br> Historical Values | $\mathbf{f}_{\mathbf{1}}$ |
| :---: | :---: |
| 5 | 1.24 |
| 6 | 1.05 |
| 7 | .92 |
| 8 | .84 |
| 9 | .77 |
| 10 | .72 |
| 11 | .67 |
| 12 | .64 |
| 14 | .58 |
| 15 | .55 |
| 16 | .53 |
| 18 | .50 |
| 20 | .47 |
| 25 | .41 |
| 30 | .37 |

## Example

# Suppose the historical average based on 10 measurements taken from the last time a given part number was run is 20.8 and the sample standard deviation was 1.07. Determine if the nominal of 20.0 or the historical average of 20.4 should be used. 

## Solution

- Calculate the difference
- Multiply the $f_{1}$ value times the standard deviation
- Compare the difference and the product

## Short Run X Bar and R Chart

- Average ranges for different products produced on the same process are significantly different
- Data is transformed
- Ranges
- Averages

# Short Run X Bar and R Chart Plot Point Calculations 

$$
\begin{aligned}
& \text { R Plot Point }=\frac{R}{\operatorname{Trg} t \bar{R}} \\
& \overline{\mathrm{X}} \text { Plot Point }=\frac{\operatorname{Subgroup} \bar{X}-\operatorname{Trg} t \bar{X}}{\operatorname{Trgt} \bar{R}}
\end{aligned}
$$

## Control Limits

- Short Run Range Chart
- $\mathrm{UCL}=\mathrm{D}_{4}$
- $\mathrm{LCL}=\mathrm{D}_{3}$
- Short Run Average Chart
- $\mathrm{UCL}=+\mathrm{A}_{2}$
$-\mathrm{LCL}=-\mathrm{A}_{2}$

## Determining Target Values Average and Range

1) Prior charts for this part number
2) Historical data

- Target average is average of historical data
- Target range is $\mathrm{f}_{2} \mathrm{~s}$
(Values found on following page)

## Values of $f_{2}$

| Total Number of Measurements | Sample <br> Size <br> 2 | 3 | 4 | 5 | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 5 | 1.20 | 1.80 | 2.19 | 2.41 | 2.70 |
| 10 | 1.16 | 1.74 | 2.12 | 2.39 | 2.60 |
| 15 | 1.15 | 1.72 | 2.10 | 2.37 | 2.58 |
| 20 | 1.14 | 1.72 | 2.09 | 2.36 | 2.57 |
| 25 | 1.14 | 1.71 | 2.08 | 2.35 | 2.56 |
| 30 | 1.13 | 1.69 | 2.06 | 2.33 | 2.53 |

## Determining Target Values Average and Range

Prior experience on similar part numbers. New averages equal old averages.
4) Specification limit.

Target average = nominal print specification Target average range =

$$
\text { Target } \bar{R}=\frac{\left(d_{2}\right)(U S L-L S L)}{6 C p k}
$$

## Example

# Construct short run x bar and R chart control limits for the data on the following page. 

## Data Set 2-3-2

## Example

|  | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{M}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{M}$ | $\mathbf{M}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{M}$ | $\mathbf{A}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0.50 | 0.00 | 4.50 | -1.00 | -1.00 | -0.50 | 6.00 | 5.50 | 2.00 | 0.00 | 1.00 | 5.00 | 1.50 |

| C | 24 | 22 | 23 | 24 | 24 | 22.75 |  | 2.6 |  |  |  |
| C | 23 | 25 | 24 | 23 | 24 | 22.75 |  | 2.6 |  |  |  |

Short Run Individual and Moving Range Chart Formulas

$$
\begin{aligned}
& U C L X=\bar{X}+(2.66) \overline{M R} \\
& L C L X=\bar{X}-(2.66) \overline{M R} \\
& U C L M R=(3.27) \overline{M R} \\
& L C L M R=0
\end{aligned}
$$

## Nominal Individual and Moving Range Chart

## X Plot Point $=x-$ nominal

## MR Plot Point $=\mid(\text { X Plot Point })_{i}-\left(\right.$ X Plot Point $_{i-1} \mid$

## Target Individual and Moving Range Chart

X Plot Point $=\mathrm{x}-$ target average MR Plot Point $=\mid(X \text { Plot Point })_{i}-(X \text { Plot Point })_{i-1} \mid$

$$
\begin{aligned}
& \mathrm{X} \text { Plot Point }=\frac{\mathrm{x}-\text { target average }}{\text { target average range }} \\
& \text { MR Plot Point }=\mid\left({\text { X Plot Point })_{\mathrm{i}}}-(\mathrm{X} \text { Plot Point })_{\mathrm{i}-1} \mid\right. \\
& U C L_{X}=+2.66 \\
& L C L_{X}=-2.66 \\
& U C L_{M R}=3.27 \\
& L C L_{\overline{M R}}=0
\end{aligned}
$$

## Practice

Use the following data to calculate short run individuals and moving range control limits using the nominal method.

## Data Set 2-3-3

| Sample | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value | 6 | 9 | 8 | 13 | 13 | 12 | 12 | 7 | 8 | 9 | 8 | 11 |
| Nominal | 8 | 8 | 8 | 12 | 12 | 12 | 12 | 8 | 8 | 8 | 8 | 12 |
| MR |  |  |  |  |  |  |  |  |  |  |  |  |

## One More Practice Problem

## Data Set 2-3-4

## Attribute Charts

| Chart | Target | Plot Point |
| :---: | :---: | :---: |
| np | np | $\frac{\text { Actual np-Target } \mathrm{n} \overline{\mathrm{p}}}{\sqrt{\mathrm{n} \overline{\mathrm{p}}(1-\overline{\mathrm{p}})}}$ |
| $p$ | $\overline{\mathrm{p}}$ | $\frac{\text { Actual } \mathrm{p}-\text { Target } \overline{\mathrm{p}}}{\sqrt{\frac{\mathrm{p}(1-\overline{\mathrm{p}})}{\mathrm{n}}}}$ |
| C | $\overline{\mathrm{C}}$ | $\frac{\text { Actual } \mathrm{c} \text { - Target } \overline{\mathrm{c}}}{\sqrt{\overline{\mathrm{c}}}}$ |
| u | U | $\frac{\text { Actual } u \text { - Target } \bar{u}}{\sqrt{\frac{\bar{u}}{n}}}$ |

## Review

Control limits describe of a stable representative nature control limits process. Specifically, limits of identify the expect or chance variation that is monitored. process being
