# **Site-Level NMEC**

# **Challenges and Best Practices**

David Jump, PhD, P.E. CMVP Director kW Engineering

## **Overview**

- Site-Level NMEC projects
  - -Incentives based on savings achieved (P4P)
  - -Savings based on meter-based analysis
  - -NMEC (& HOPP) Programs
- Example Projects
- Challenges & Best Practices

# **Available Programs in CA**

- Southern California Edison
  - Public Sector (HOPP)
- Southern California Gas
  - Public Sector Monitoring and Performance Based Retrofits (HOPP)
- Pacific Gas & Electric (NMEC)
  - Public Sector
  - Commercial Whole Building
- Emerging Technologies evaluation methodology
  - Integrated monitoring and control devices for SMB
- Third Party Programs (Bidding Stage)
  - > 50% of proposed programs are NMEC (rumor)

#### **Baseline** Period

- 1. Project Pre-Screening
  - Facility condition
  - Savings potential (e.g. deep savings)
  - 'Predictable' energy use patterns
  - Non-routine events (NREs)
- 2. Develop Energy Audit / Energy Management Plan
  - Documentation of baseline equipment and conditions

Install

• List of measures, savings, costs, measure life

#### 3. M&V Plan

30,000

25,000

20,000

15,000

10,000

5,000

Define baseline period

Baseline

m Mm mmm

- List data to be collected
- Describe analysis procedures
  - incl. NRE treatment
- Savings reporting & frequency

## **Installation** Period

4. Measure Verification

1<sup>st</sup> Performance Period

- Document installation & proper operation
  - Inspection
  - Functional testing
  - Trend analysis

#### Performance Period

- 5. Savings Status Report
  - Periodically during performance period
  - QA check that savings are accruing
  - Detect presence of NREs

## 6. Savings Reporting

Per M&V Plan

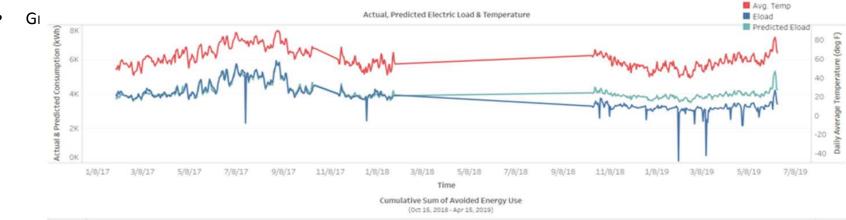

2<sup>nd</sup> Performance Period

- A to Z report on savings
  - Raw data to final savings

Metered kW

NRE impacts included

## **Southern California Grocery Store**

# **UCSB – Chemistry and Physical Sciences**

- Large laboratory with two wings: Chem and PSBN
  - Regularly scheduled and temperature sensitive
- Each wing has: (6 energy sources/meters total)
  - Electric meter
  - Gas meter
  - Chilled Water System serving campus loop (not just building)
    - Chem: Existing CHWS (poor baseline model)
    - PSBN: CHWS installed during project
- Campus has large PV generation
- Ample sub-metering

## **UCSB - Measures**

Measure	Description	Installed in	
		PSBN	Chem
RCx-1	Rebalance Constant Volume Hood Airflow	Х	
CIM-1	Install Wireless Pneumatic Thermostats	Х	
RCx-2	Implement Supply Air Temperature Setpoint Reset	Х	Х
RCx-3	Implement Heating Hot Water Setpoint Reset	Х	
RCx-4	Implement Nighttime Space Temperature Setbacks	Х	Х
CIM-2	Machine Shop LEDs		Х
CIM-3	Replace Linear Fluorescent Lamps with LED Ballast Bypass Lamps	Х	Х
CIM-6	Supplement Backup Generator Block Heaters with Heat Pumps	Х	

**UCSB Savings** August 31, 2019 kWh Saved: 815,073 kWh kWh 50,000 Building (AII) 45,000 O Chem O PSBN 40,000 Energy Stream Electric Gas 35,000 CHW 30,000 Avoided Energy Use (kBtu) 25,000 20,000 15,000 10,000 5,000 1 Sep 1, 19 0 -5,000 -10,000 -15,000

# **Site-Level NMEC Risks**

- Building not 'predictable'
  - Energy use not explained by weather or schedule (N
  - Modeling algorithms insufficient
  - Too many NREs
  - Addressed through pre-screening

- Non-Routine Events
  (NREs)
  Discussed by LBNI
  - Discussed by LBNL next

## **Best Practices**

- Predictable Buildings
  - Regularly scheduled, temperaturesensitive
- Manageable NREs
- Deep savings projects
  > 10% of base year use

- Savings Persistence Tools e.g. EMIS Platforms
- Compatible with Integrated Distributed Energy Resources (IDER)
  - Demand Response similar meterbased approach
  - Renewables monitor generation
