#### Abstract

Rotating multilayer cylinder subjected to internal pressure and/or radial temperature gradient finds several applications, e.g. mold of centrifugal casting machine. The cylinder wall may undergo elastic deformation during the operation. The present study deals with thermo-elastic stress analysis of rotating multilayer cylinder subjected to internal pressure and radial thermal gradient. Multilayer compound cylinder is usually tailor made in order to satisfy the requirement of working in extreme operating conditions characterized by high temperature, high pressure and/or corrosive environment. This paper presents a basic model that can be used to study the effects of rotation, internal pressure and temperature on the stress distributions and displacement fields in multilayer compound cylinders. The results of the developed analytical approach are compared with published research paper and validated.

Index Terms: Multilayer cylinder, rotation, internal pressure, temperature gradient.

## I. INTRODUCTION

In many industrial applications, the cylinders are often subjected to extreme operating conditions characterized by high temperature, high pressure and/or corrosive environment. Conventional cylinder made of single material can barely satisfy the requirements for service in extreme operating condition. Therefore, a multilayered composite cylinder is usually tailor-made to satisfy the particular requirements, using different layer. Most cylinders used in industry, are subjected to thermal loads produced by temperature variation in addition to mechanical loads. Thermal load has a significant influence on the stress distribution of a multilayered composite pressure vessel because it is made of materials with different coefficients of thermal expansion and constructed by shrink fitting. So, it is important to derive solution for multilayer cylinder subjected to thermo-mechanical load. In case of multilayer cylinder, a larger number of design variables are available to the designer.

A cylinder made of two or more layer is known as multilayer cylinder. In a multilayer compound cylinder the outer cylinder is shrunk fit over the inner cylinder by heating and cooling. On cooling, the contact pressure is developed at the junction of the two cylinders, induces compressive tangential stress in the material of the inner
cylinder and tensile tangential stress in the material of the outer cylinder. When the cylinder is loaded, the compressive stresses are first relieved and then tensile stresses are induced. Hence, a multilayer compound cylinder is effective in resisting higher internal pressure than single cylinder with the same overall dimension.

A deformation of cylinder subjected to various thermo-mechanical loads has been investigated by many researchers. Initially the French mathematician Gabriel Lame presented an analytical solution of cylinder made of homogeneous and isotropic material exposed to external and internal pressure. This problem has been extended to consider the thermal stresses in number of work. Whalley has presented a series of papers on design of shell subjected to thermal stresses in addition to pressure with different authors. In part IV of that series, Whalley and Morris [1] have discussed the design of multilayer vessel subjected to thermal stress. It was shown that thermal and pressure stresses may add or subtract at any point within the vessel. In part IV, Whalley and Mackinnon [2] applied this theory considering transient thermal stress. Bahoum and Diany [3] presented a basic model that can be used to study the effects of temperature and internal pressure on the stress distributions and displacement fields in compound cylinders. In this model, two layer compound cylinder was considered with logarithmic radial temperature distribution. Stress distribution is obtained for two cylinder layer made of same material steel ASTM A564 H1150 and cylinder layer made of different material steel ASTM A564 H1150 and aluminum 1050A-H9. It was shown that to ensure permanent contact between two cylinders the minimum temperature $\mathrm{T}_{1}$ is around $100{ }^{\circ} \mathrm{C}$ when $\mathrm{T}_{3}$ is the ambient temperature. The results of the analytical solution were compared and validated to finite element axis symmetric model. Anani and Rahimi [4] analyzed rotating thickwalled hollow cylindrical shell composed of functionally graded material by using the theory of hyper elasticity. Radial stress, circumferential stress and longitudinal stress as a function of radial direction are plotted for different values of $n$. The obtained results show that the material inhomogeneity parameter ( n ) and structure parameter ( $\beta$ : ratio of outer radius to inner radius) have a significant influence on the mechanical behavior of rotating thick-walled hollow cylindrical shell made of functionally graded materials with power law varying properties.
A cylinder subjected pressure and thermal load made of a homogenous material or functionally graded material (FGM) has been investigated by number of researches till now. Research work related to cylinder subjected to pressure, rotation and radial temperature gradient is missing in this literature survey. Hence, aim of the present investigation is to develop analytical solution of multilayer cylinder subjected to internal pressure, rotation and radial temperature gradient.

## II. ANALYTICAL FORMULATION OF MULTILAYER CYLINDER

A Two layer cylinder with internal radius a , mid radius b and external radius c is considered for the mathematical modeling. A general equation for the cylinder is derived first and then this equation is applied to each layer of the multilayer cylinder and these equations are solved using the boundary condition for the multilayer cylinder.

The equation of equilibrium in radial direction and strain-displacement relationship for the rotating cylinder under axisymmetric loading condition is written as [5],

$$
\begin{align*}
& \frac{\mathrm{d} \sigma_{\mathrm{r}}}{\mathrm{dr}}+\frac{\sigma_{\mathrm{r}}-\sigma_{\mathrm{t}}}{\mathrm{r}}+\gamma \omega^{2} \mathrm{r}=0  \tag{1}\\
& \varepsilon_{\mathrm{r}}=\frac{\mathrm{du}}{\mathrm{dr}} \quad \& \quad \varepsilon_{\mathrm{t}}=\frac{\mathrm{u}}{\mathrm{r}} \tag{2}
\end{align*}
$$

Hooke's constitutive laws for the tri-axial stress state in the linear elastic field with thermal loading are as follows

$$
\begin{align*}
& \varepsilon_{\mathrm{r}}=\frac{1}{\mathrm{E}}\left(\sigma_{\mathrm{r}}-\mathrm{v}\left(\sigma_{\mathrm{t}}+\sigma_{\mathrm{z}}\right)\right)+\alpha \mathrm{T}  \tag{3}\\
& \varepsilon_{\mathrm{t}}=\frac{1}{\mathrm{E}}\left(\sigma_{\mathrm{t}}-\mathrm{v}\left(\sigma_{\mathrm{r}}+\sigma_{\mathrm{z}}\right)\right)+\alpha \mathrm{T}  \tag{4}\\
& \varepsilon_{\mathrm{z}}=\frac{1}{\mathrm{E}}\left(\sigma_{\mathrm{z}}-\mathrm{v}\left(\sigma_{\mathrm{r}}+\sigma_{\mathrm{t}}\right)\right)+\alpha \mathrm{T} \tag{5}
\end{align*}
$$

From above Eq. 3-5 values of $\sigma_{\mathrm{r}}, \sigma_{\mathrm{t}}$ and $\sigma_{\mathrm{z}}$ is given by

$$
\begin{align*}
& \sigma_{\mathrm{r}}=\frac{\mathrm{E}}{(1+\mathrm{v})}\left(\frac{\mathrm{v} \cdot \mathrm{e}}{1-2 \mathrm{v}}+\mathrm{v} \varepsilon_{\mathrm{r}}\right)-\frac{\mathrm{E}}{(1-2 \mathrm{v})} \cdot \alpha \mathrm{T}  \tag{6}\\
& \sigma_{\mathrm{t}}=\frac{\mathrm{E}}{(1+\mathrm{v})}\left(\frac{\mathrm{v} \cdot \mathrm{e}}{1-2 \mathrm{v}}+\mathrm{v} \varepsilon_{\mathrm{t}}\right)-\frac{\mathrm{E}}{(1-2 \mathrm{v})} \cdot \alpha \mathrm{T}  \tag{7}\\
& \sigma_{\mathrm{z}}=\frac{\mathrm{E}}{(1+\mathrm{v})}\left(\frac{\mathrm{v} \cdot \mathrm{e}}{1-2 \mathrm{v}}+\mathrm{v} \mathrm{\varepsilon}_{\mathrm{z}}\right)-\frac{\mathrm{E}}{(1-2 \mathrm{v})} \cdot \alpha \mathrm{T} \tag{8}
\end{align*}
$$

Obtaining the value of $\frac{\mathrm{d} \sigma_{\mathrm{r}}}{\mathrm{dr}}$ and $\frac{\sigma_{\mathrm{r}}-\sigma_{\mathrm{t}}}{\mathrm{r}}$ using the Eq. 6 and 7.

$$
\begin{align*}
& \frac{\mathrm{d} \sigma_{\mathrm{r}}}{\mathrm{dr}}=\frac{\mathrm{E}}{1+\mathrm{v}}\left(\frac{\mathrm{v}}{1-2 \mathrm{v}}\left(\frac{\mathrm{~d}^{2} \mathrm{u}}{\mathrm{dr}}+\frac{1}{\mathrm{r}} \cdot \frac{\mathrm{du}}{\mathrm{dr}}-\frac{\mathrm{u}}{\mathrm{r}^{2}}\right)+\frac{\mathrm{d}^{2} u}{\mathrm{dr}^{2}}\right)-\frac{\mathrm{E}}{1-2 \mathrm{v}} \cdot \alpha \frac{\mathrm{dT}}{\mathrm{dr}}  \tag{9}\\
& \frac{\sigma_{\mathrm{r}}-\sigma_{\mathrm{t}}}{\mathrm{r}}=\frac{\mathrm{E}}{1+\mathrm{v}}\left(\frac{1}{\mathrm{r}} \cdot \frac{\mathrm{du}}{\mathrm{dr}}-\frac{\mathrm{u}}{\mathrm{r}^{2}}\right) \tag{10}
\end{align*}
$$

Substituting the value of Eq. 9 and 10 in Eq. 1, we get the following governing differential equation for the rotating cylinder subjected to radial thermal gradient.

$$
\begin{align*}
& \frac{d^{2} u}{d r^{2}}+\frac{1}{r} \frac{d u}{d r}-\frac{u}{r^{2}}-\left(\frac{1+v}{1-v}\right) \alpha \frac{d T}{d r}+\frac{(1+v)(1-2 v)}{E(1-v)} \gamma \omega^{2} r=0  \tag{11}\\
& \frac{d}{d r}\left(\frac{1}{r} \cdot \frac{d}{d r}(u \cdot r)\right)-\left(\frac{1+v}{1-v}\right) \alpha \frac{d T}{d r}+\frac{(1+v)(1-2 v)}{E(1-v)} \gamma \omega^{2} r=0 \tag{12}
\end{align*}
$$

Integrating the above equation to obtain the displacement $u$ which involves two integration constants $C_{1}$ and $C_{2}$,

$$
\begin{equation*}
u=\alpha \cdot \frac{1+v}{1-v} \cdot \frac{1}{r} \cdot \int_{r_{i}}^{r} T \cdot r \cdot d r-\frac{(1+v)(1-2 v)}{E(1-v)} \cdot \frac{\gamma \omega^{2} r^{3}}{8}+\frac{C_{1}}{2} \cdot r+\frac{C_{2}}{r} \tag{13}
\end{equation*}
$$

Differentiating the above equation, we get

$$
\begin{equation*}
\frac{\mathrm{du}}{\mathrm{dr}}=\frac{1+\mathrm{v}}{1-\mathrm{v}} \cdot \alpha \cdot \mathrm{~T}-\alpha \cdot \frac{1+\mathrm{v}}{1-\mathrm{v}} \cdot \frac{1}{\mathrm{r}^{2}} \int_{\mathrm{r}_{\mathrm{i}}}^{\mathrm{r}} \mathrm{~T} \cdot \mathrm{r} \cdot \mathrm{dr}=-\frac{(1+\mathrm{v})(1-2 \mathrm{v})}{\mathrm{E}(1-\mathrm{v})} \cdot \frac{3 \gamma \omega^{2} \mathrm{r}^{2}}{8}+\frac{\mathrm{C}_{1}}{2}-\frac{\mathrm{C}_{2}}{\mathrm{r}^{2}} \tag{14}
\end{equation*}
$$

From this, value of radial and tangential strain is given by following equation

$$
\begin{equation*}
\varepsilon_{\mathrm{r}}=\frac{\mathrm{du}}{\mathrm{dr}}=\frac{1+\mathrm{v}}{1-\mathrm{v}} \cdot \alpha \cdot \mathrm{~T}-\alpha \cdot \frac{1+\mathrm{v}}{1-\mathrm{v}} \cdot \frac{1}{\mathrm{r}^{2}} \int_{\mathrm{r}_{\mathrm{i}}}^{\mathrm{r}} \mathrm{~T} \cdot \mathrm{r} \cdot \mathrm{dr}=-\frac{(1+\mathrm{v})(1-2 \mathrm{v})}{\mathrm{E}(1-\mathrm{v})} \cdot \frac{3 \gamma \omega^{2} \mathrm{r}^{2}}{8}+\frac{\mathrm{C}_{1}}{2}-\frac{\mathrm{C}_{2}}{\mathrm{r}^{2}} \tag{15}
\end{equation*}
$$

$$
\begin{equation*}
\varepsilon_{\mathrm{t}}=\frac{\mathrm{u}}{\mathrm{r}}=\alpha \cdot \frac{1+\mathrm{v}}{1-\mathrm{v}} \cdot \frac{1}{\mathrm{r}^{2}} \cdot \int_{\mathrm{r}_{\mathrm{i}}}^{\mathrm{r}} \mathrm{~T} \cdot \mathrm{r} \cdot \mathrm{dr}-\frac{(1+\mathrm{v})(1-2 \mathrm{v})}{\mathrm{E}(1-\mathrm{v})} \cdot \frac{\gamma \omega^{2} \mathrm{r}^{2}}{8}+\frac{\mathrm{C}_{1}}{2}+\frac{\mathrm{C}_{2}}{\mathrm{r}^{2}} \tag{16}
\end{equation*}
$$

As per the generalized plane strain assumption, axial strain for multilayer cylinder is given by Eq. 17 .

$$
\begin{equation*}
\varepsilon_{\mathrm{z}}=\text { constant }=\varepsilon_{0} \tag{17}
\end{equation*}
$$

Substituting the values of $\varepsilon_{\mathrm{r}}, \varepsilon_{\mathrm{t}}$ and $\varepsilon_{\mathrm{z}}$ from Eq. 15 to 17 in Eq. 6 to 8 and simplifying, we get
$\sigma_{r}=\frac{E \cdot C_{1}}{2(1+v)(1-2 v)}-\frac{E \cdot C_{2}}{(1+v)} \cdot \frac{1}{r^{2}}-\frac{(3-2 v)}{8(1-v)} \cdot \gamma \omega^{2} r^{2}-\frac{\alpha E}{(1-v)} \frac{1}{r^{2}} \int_{r_{i}}^{r} T \cdot r \cdot d r+\frac{E v}{(1+v)(1-2 v)} \cdot \varepsilon_{0}$
$\sigma_{\mathrm{t}}=\frac{\mathrm{E} \cdot \mathrm{C}_{1}}{2(1+\mathrm{v})(1-2 \mathrm{v})}+\frac{\mathrm{E} \cdot \mathrm{C}_{2}}{(1+\mathrm{v})} \frac{1}{\mathrm{r}^{2}}-\frac{(1+2 \mathrm{v})}{8(1-\mathrm{v})} \cdot \gamma \omega^{2} \mathrm{r}^{2}+\frac{\alpha \mathrm{E}}{(1-\mathrm{v})} \frac{1}{\mathrm{r}^{2}} \int_{\mathrm{r}_{\mathrm{i}}}^{\mathrm{r}} \mathrm{T} \cdot \mathrm{r} \cdot \mathrm{dr}+\frac{\mathrm{Ev}}{(1+\mathrm{v})(1-2 \mathrm{v})} \cdot \varepsilon_{0}-\frac{\alpha \mathrm{TE}}{(1-\mathrm{v})}$
$\sigma_{\mathrm{z}}=\frac{\mathrm{E} \cdot \mathrm{C}_{1} \cdot \mathrm{v}}{(1+\mathrm{v})(1-2 \mathrm{v})}-\frac{\mathrm{v}}{(1-\mathrm{v})} \cdot \frac{\gamma \omega^{2} \mathrm{r}^{2}}{2}+\frac{\mathrm{E}(1-\mathrm{v})}{(1+\mathrm{v})(1-2 \mathrm{v})} \cdot \varepsilon_{0}-\frac{\alpha \mathrm{TE}}{(1-\mathrm{v})}$

Using equations 18 to 20 of a single layer cylinder, the equation of a multilayer cylinder is given by Eq. 21 to 23. Where i is the number of layers ( $\mathrm{i}=2$ for this case). Equation involves $2 \mathrm{i}+1$ unknown ( 5 unknown for this case).

$$
\begin{align*}
& \sigma_{r}^{i}(r)=\frac{E_{i} \cdot c_{i 1}}{2\left(1+v_{i}\right)\left(1-2 v_{i}\right)}-\frac{E_{i} \cdot C_{i 2}}{\left(1+v_{i}\right)} \cdot \frac{1}{r^{2}}-\frac{\left(3-2 v_{i}\right)}{8\left(1-v_{i}\right)} \cdot \gamma_{i} \omega^{2} \cdot r^{2}-\frac{\alpha_{i} E_{i}}{(1-v)} \cdot \frac{1}{r^{2}} \cdot \int_{r_{i}}^{r} T_{c y i} \cdot r d r+\frac{E_{i} V_{i}}{\left(1+v_{i}\right)\left(1-2 v_{i}\right)} \cdot \varepsilon_{0} \\
& \sigma_{t}^{i}(r)=\frac{E_{i} \cdot C_{i 1}}{2\left(1+v_{i}\right)\left(1-2 v_{i}\right)}+\frac{E_{i} \cdot C_{i 2}}{\left(1+v_{i}\right)} \cdot \frac{1}{r^{2}}-\frac{\left(1+2 v_{i}\right)}{8\left(1-v_{i}\right)} \cdot \gamma_{i} \omega^{2} \cdot r^{2}+\frac{\alpha_{i} E_{i}}{\left(1-v_{i}\right)} \cdot \frac{1}{r^{2}} \cdot \int_{r_{i}}^{r} T_{c y i} \cdot r \cdot \operatorname{dr}^{-}-\frac{\alpha_{i} E_{i} T_{c y i}}{\left(1-v_{i}\right)}+  \tag{21}\\
& \frac{\mathrm{E}_{\mathrm{i}} \mathrm{v}_{\mathrm{i}}}{\left(1+\mathrm{v}_{\mathrm{i}}\right)\left(1-2 \mathrm{v}_{\mathrm{i}}\right)} \cdot \varepsilon_{0}  \tag{22}\\
& \sigma_{z}^{i}(r)=\frac{E_{i} \cdot c_{i 1} \cdot v_{i}}{\left(1+v_{i}\right)\left(1-2 v_{i}\right)}-\frac{v_{i}}{\left(1-v_{i}\right)} \cdot \frac{\gamma_{i} \omega^{2} r^{2}}{2}-\frac{\alpha_{i} E_{i} T_{c y i}}{\left(1-v_{i}\right)}+\frac{E_{i}\left(1-v_{i}\right)}{\left(1+v_{i}\right)\left(1-2 v_{i}\right)} \cdot \varepsilon_{0}  \tag{23}\\
& u^{i}(r)=\alpha_{i} \cdot \frac{1+v_{i}}{1-v_{i}} \cdot \frac{1}{r} \cdot \int_{r_{i}}^{r} T_{c y i} \cdot r \cdot d r-\frac{\left(1+v_{i}\right)\left(1-2 v_{i}\right)}{E\left(1-v_{i}\right)} \cdot \frac{\gamma_{i} \omega^{2} r^{3}}{8}+\frac{C_{i 1}}{2} \cdot r+\frac{C_{i 2}}{r} \tag{24}
\end{align*}
$$

Temperature distribution in each layer is given by the following equation.

$$
\begin{equation*}
\mathrm{T}_{\mathrm{cyi}}=\mathrm{T}_{\mathrm{ou}}+\left(\mathrm{T}_{\mathrm{in}}-\mathrm{T}_{\mathrm{ou}}\right) \frac{\ln \left(\frac{r}{r_{o u}}\right)}{\ln \left(\frac{r_{\text {in }}}{r_{o u}}\right)} \tag{25}
\end{equation*}
$$

Equation for two layer cylinder involves 5 unknowns to be determined. These unknowns are determined using the following five conditions $[3,5]$.

1. $\sigma_{\mathrm{r}}^{1}(\mathrm{a})=-\mathrm{P}_{\mathrm{i}}$
2. $\sigma_{\mathrm{r}}^{2}(\mathrm{c})=0$
3. $\sigma_{\mathrm{r}}^{1}(\mathrm{~b})=\sigma_{\mathrm{r}}^{2}(\mathrm{~b})$
4. $u^{1}(b)=u^{2}(b)$
5. $\mathrm{F}_{\mathrm{z}}=\sum_{\mathrm{i}=1}^{2} \int \sigma_{\mathrm{z}}^{\mathrm{i}} \cdot \mathrm{dA}=\mathrm{P}_{\mathrm{i}} \cdot \pi \mathrm{r}_{\mathrm{i}}^{2}$
I. $\quad \sigma_{\mathrm{r}}^{1}(\mathrm{a})=-\mathrm{P}_{\mathrm{i}}$
$\frac{E_{1}}{2\left(1+v_{1}\right)\left(1-2 v_{1}\right)} C_{11}-\frac{E_{1}}{\left(1+v_{1}\right) a^{2}} C_{12}+\frac{\mathrm{E}_{1} \mathrm{v}_{1}}{\left(1+\mathrm{v}_{1}\right)\left(1-2 \mathrm{v}_{1}\right)} \varepsilon_{0}=\frac{3-2 \mathrm{v}_{1}}{8\left(1-\mathrm{v}_{1}\right)} \gamma_{1} \omega^{2} a^{2}-P_{i}$
$\mathrm{k}_{1} \mathrm{C}_{11}-\mathrm{k}_{2} \mathrm{C}_{12}+\mathrm{k}_{3} \varepsilon_{0}=\mathrm{M}_{1}$
II. $\quad \sigma_{\mathrm{r}}^{2}(\mathrm{c})=0$
$\frac{E_{2}}{2\left(1+v_{2}\right)\left(1-2 v_{2}\right)} C_{21}-\frac{E_{2}}{\left(1+v_{2}\right) c^{2}} C_{22}+\frac{E_{2} v_{2}}{\left(1+v_{2}\right)\left(1-2 v_{2}\right)} \varepsilon_{0}=\frac{3-2 v_{2}}{8\left(1-v_{2}\right)} \gamma_{2} \omega^{2} c^{2}+\frac{\alpha_{2} E_{2}}{\left(1-v_{2}\right) c^{2}} \int_{b}^{c} T \cdot r d r$
$\mathrm{k}_{4} \mathrm{C}_{21}-\mathrm{k}_{5} \mathrm{C}_{22}+\mathrm{k}_{6} \varepsilon_{0}=\mathrm{M}_{2}$

$$
\begin{aligned}
& M_{3}=\frac{3-2 v_{1}}{8\left(1-v_{1}\right)} \gamma_{1} \omega^{2} b^{2}-\frac{3-2 v_{2}}{8\left(1-v_{2}\right)} \gamma_{2} \omega^{2} b^{2}+\frac{\alpha_{1} E_{1}}{\left(1-v_{1}\right) b^{2}} \int_{a}^{b} T \cdot r \cdot d r \\
& M_{4}=\frac{\left(1+v_{1}\right)\left(1-2 v_{1}\right)}{1-v_{1}} \cdot \frac{\gamma_{1} \omega^{2} b^{2}}{8 E_{1}}-\frac{\left(1+v_{2}\right)\left(1-2 v_{2}\right)}{1-v_{2}} \cdot \frac{\gamma_{2} \omega^{2} b^{2}}{8 E_{2}}-\frac{1+v_{1}}{1-v_{1}} \cdot \frac{\alpha_{1}}{b^{2}} \int_{a}^{b} T r d r \\
& M_{5}=\frac{v_{1} \gamma_{1} \omega^{2}}{8\left(1-v_{1}\right)}\left(b^{4}-a^{4}\right)+\frac{v_{2} \gamma_{2} \omega^{2}}{8\left(1-v_{2}\right)}\left(c^{4}-b^{4}\right)+\frac{\alpha_{1} E_{1}}{\left(1-v_{1}\right)} \int_{a}^{b} T \cdot r d r+\frac{\alpha_{2} E_{2}}{\left(1-v_{2}\right)} \int_{b}^{c} T \cdot r d r+\frac{1}{2} P_{i} \cdot r_{i}^{2}
\end{aligned}
$$

Arranging the equation in the matrix form

$$
\left[\begin{array}{ccccc}
\mathrm{k}_{1} & -\mathrm{k}_{2} & 0 & 0 & \mathrm{k}_{3} \\
0 & 0 & \mathrm{k}_{4} & -\mathrm{k}_{5} & \mathrm{k}_{6} \\
\mathrm{k}_{1} & -\mathrm{k}_{7} & -\mathrm{k}_{4} & \mathrm{k}_{8} & \mathrm{k}_{9} \\
1 / 2 & \mathrm{k}_{10} & -1 / 2 & -\mathrm{k}_{10} & 0 \\
\mathrm{k}_{11} & 0 & \mathrm{k}_{12} & 0 & \mathrm{k}_{13}
\end{array}\right]\left[\begin{array}{l}
\mathrm{C}_{11} \\
\mathrm{C}_{12} \\
\mathrm{C}_{21} \\
\mathrm{C}_{22} \\
\varepsilon_{0}
\end{array}\right]=\left[\begin{array}{l}
\mathrm{M}_{1} \\
\mathrm{M}_{2} \\
\mathrm{M}_{3} \\
\mathrm{M}_{4} \\
\mathrm{M}_{5}
\end{array}\right]
$$

Solution above $5 \times 5$ system of equation gives the value of $\mathrm{C}_{11}, \mathrm{C}_{12}, \mathrm{C}_{21}, \mathrm{C}_{22}$ and $\varepsilon_{0}$. Hence, stress distribution and displacement field for the two layer cylinder is given by the equation 31 to 34 , where i $=1,2$.
$\sigma_{r}^{i}(r)=\frac{E_{i} \cdot C_{i 1}}{2\left(1+v_{i}\right)\left(1-2 v_{i}\right)}-\frac{E_{i} C_{i 2}}{\left(1+v_{i}\right)} \cdot \frac{1}{r^{2}}-\frac{\left(3-2 v_{i}\right)}{8\left(1-v_{i}\right)} \cdot \gamma_{i} \omega^{2} \cdot r^{2}-\frac{\alpha_{i} E_{i}}{(1-v)} \cdot \frac{1}{r^{2}} \cdot \int_{r_{i}}^{r} T_{c y i} \cdot r d r+\frac{E_{i} v_{i}}{\left(1+v_{i}\right)\left(1-2 v_{i}\right)} \cdot \varepsilon_{0}$
$\sigma_{t}^{i}(r)=\frac{E_{i} \cdot C_{i 1}}{2\left(1+v_{i}\right)\left(1-2 v_{i}\right)}+\frac{E_{i} \cdot C_{i 2}}{\left(1+v_{i}\right)} \cdot \frac{1}{r^{2}}-\frac{\left(1+2 v_{i}\right)}{8\left(1-v_{i}\right)} \cdot \gamma_{i} \omega^{2} \cdot r^{2}+\frac{\alpha_{i} E_{i}}{\left(1-v_{i}\right)} \cdot \frac{1}{r^{2}} \cdot \int_{r_{i}}^{r} T_{c y i} \cdot r \cdot d r-\frac{\alpha_{i} E_{i} T_{c y i}}{\left(1-v_{i}\right)}+$

$$
\begin{equation*}
\frac{\mathrm{E}_{i} \mathrm{v}_{\mathrm{i}}}{\left(1+\mathrm{v}_{\mathrm{i}}\right)\left(1-2 \mathrm{v}_{\mathrm{i}}\right)}, \varepsilon_{0} \tag{32}
\end{equation*}
$$

$\sigma_{z}^{i}(r)=\frac{E_{i} \cdot C_{i 1} \cdot v_{i}}{\left(1+v_{i}\right)\left(1-2 v_{i}\right)}-\frac{v_{i}}{\left(1-v_{i}\right)} \cdot \frac{\gamma_{i} \omega^{2} r^{2}}{2}-\frac{\alpha_{i} E_{i} T_{c y i}}{\left(1-v_{i}\right)}+\frac{E_{i}\left(1-v_{i}\right)}{\left(1+v_{i}\right)\left(1-2 v_{i}\right)} \cdot \varepsilon_{0}$
$u^{i}(r)=\alpha_{i} \cdot \frac{1+v_{i}}{1-v_{i}} \cdot \frac{1}{r} \cdot \int_{r_{i}}^{r} T_{c y i} \cdot r \cdot d r-\frac{\left(1+v_{i}\right)\left(1-2 v_{i}\right)}{E\left(1-v_{i}\right)} \cdot \frac{\gamma_{i} \omega^{2} r^{3}}{8}+\frac{C_{i 1}}{2} \cdot r+\frac{C_{i 2}}{r}$

## III. RESULTS AND DISCUSSION

Solution of the multilayer cylinder is used to study the stress distribution of the mold. Table 1 presents material properties, dimensions and loading conditions of the mold used for the investigation of the mold. Mold made of same material for both layer and both layer of equal thickness is considered to study the results of multilayer cylinder.

Table 1 Mold dimensions, loading conditions and material properties

| Mold material | AISI-4340 |
| :--- | :---: |
| Density ( $\Upsilon$ ) (Kg/m3) | 7800 |
| Poisson's ratio | 0.29 |
| Young's Modulus (GPa) | 210 |
| Yield Strength (MPa) | 910 |
| Thermal expansion $\left(/{ }^{\circ} \mathrm{C}\right)$ | $1.21 \mathrm{E}-05$ |
| Internal Radius (a) (mm) | 1000 |
| Mid Radius (b)(mm) | 1110 |
| External Radius (c) (mm) | 1220 |
| Length (mm) | 1000 |
| Internal Pressure (Pi) (MPa) | 5 |
| Angular velocity ( $\omega$ )(rpm) | 600 |
| Temperature at Internal radius $\left(\mathrm{T}_{1}\right)\left({ }^{\circ} \mathrm{C}\right)$ | 700 |
| Temperature at Mid radius $\left(\mathrm{T}_{2}\right)\left({ }^{\circ} \mathrm{C}\right)$ | 370 |
| Temperature at Internal radius $\left(\mathrm{T}_{2}\right)\left({ }^{\circ} \mathrm{C}\right)$ | 100 |

For obtaining stress distribution for multilayer cylinder, we require the value of temperature at mid radius $\mathrm{T}_{2}$. This value of temperature $T_{2}$ can be found using following relation for heat transfer. Once the value of $T_{2}$ is known stress distribution is obtained using the equations of two layer cylinder. Stress distribution for interference pressure equals to 5 MPa is obtained and by using the principle of super position the final stress distribution for multilayer cylinder is shown in fig. 1.

$$
\mathrm{Q}=\frac{2 \pi \mathrm{k}_{1} \mathrm{~L}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)}{\ln \left(\frac{\mathrm{b}}{\mathrm{a}}\right)}=\frac{2 \pi \mathrm{k}_{2} \mathrm{~L}\left(\mathrm{~T}_{2}-\mathrm{T}_{3}\right)}{\ln \left(\frac{\mathrm{c}}{\mathrm{~b}}\right)}
$$

Fig. 1 Stress distribution for multilayer cylinder with interference pressure $=5 \mathrm{MPa}$
Figure. 1 presents the stress distribution for multilayer cylinder subjected to internal pressure of 5 MPa , Angular velocity of 600 rpm , internal wall temperature of $700^{\circ} \mathrm{C}$ and external wall temperature of $400^{\circ} \mathrm{C}$. Radial stress is zero at internal and external radius and compressive in-between. Tangential and axial stress
varies from compressive at internal radius to tensile at external radius. Von mises stress is also obtained in order study the combined effect of radial, tangential and axial stress.

Results of this case are compared with K. Bahoum paper to validate results of the developed analytical approach. Using the material properties and other conditions from the paper and considering angular velocity as $0 \mathrm{rad} / \mathrm{sec}$ in the obtained analytical solution, results are obtained and it shows good agreement with the paper result.

Fig. 2 Comparison of radial stress with paper

Fig. 3 Comparison of tangential stress with paper

The results presented in this study are just for a selected loading combinations and for single material selected. However, analytical solution (stress distribution) for any combination of loading and material properties can be obtained.

## IV. CONCLUSION

The main objective of the current investigation is to derive analytical solution for rotating multilayer cylinder subjected to internal pressure and radial thermal gradient. The expressions of radial displacement and different stresses in the two cylinders, inner and outer, were deducted for the cases where the cylinders are made from the same materials. The results obtained in the current investigation lead to the following conclusions.

- The combined effects of rotation, internal pressure and temperature must be taken into account when designing compounds cylinders, to ensure their maximum efficiency and maximum availability.
- Effect of thermal load is dominant over the load due to internal pressure and rotation. When multilayer cylinder is subjected to combined load. The hoop stress is more affected by the variation of the temperature then the internal pressure value.
