PRYSMIAN GROUP

Prysmian Group is world leader in the energy and telecom cable systems industry. We offer the widest range of services and know-how in the business, with almost 140 years of experience, sales exceeding €11 billion, and about 29,000 employees in over 50 countries and 112 plants.

Each year, the Group manufactures thousands of miles of underground and submarine cables and systems for power transmission and distribution, as well as medium and low voltage cables for the construction and infrastructure sectors.

We also produce a comprehensive range of optical fibres, copper cables and connectivity systems for voice, video and data transmission for the telecommunications sector.

In 2018, General Cable merged with Prysmian and became part of Prysmian Group. Prysmian is a public company, listed on the Italian Stock Exchange in the FTSE MIB index.

MULTIMEDIA SOLUTIONS

Society today demands the effective delivery of information at any time, anywhere. That's why Prysmian specialises in everything to do with cables for private communication networks. Supporting wholesalers, resellers and OEMs, our solutions are designed to meet both current and future demands, with absolute reliability and total flexibility.

Our Multimedia Solutions business area manufactures and sells optical, coaxial and copper cables.

From cables for TV and film studios, rail networks and underground long-distance communication to light signalling, track switching devices and mobile telecommunications, we innovate to create next-generation communication solutions, today.

Despite the extensive use of mobile phones today, the vast majority of applications are run on cabled infrastructures. Our Multimedia Solutions department develops, produces and sells copper and optical fibre cables that cover virtually every

communications application in this field. Whatever your needs, whether you depend on network solutions to run your business, or whether you are a wholesaler, value-added reseller, or OEM, we can help you meet your current and future requirements. We offer greater bandwidths, longer-life solutions, absolute reliability and more.

Characteristic Impedance (Z)

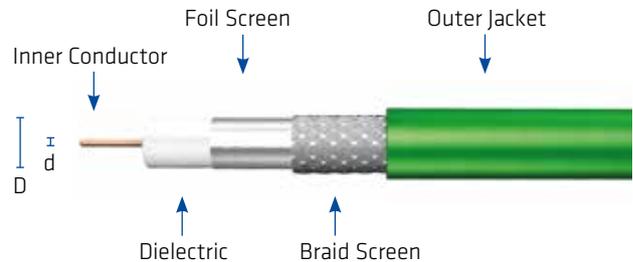

- 50 Ω for RF
- 75 Ω for Video and Community Antenna TV (CATV)

Foaming

- Chemical
- Physical

Skin Effect

- Current flows on the surface of the conductor at the high frequencies
- Reduces effective conductor area

$$Z = \frac{60}{\sqrt{\epsilon_r}} \ln \frac{D}{d}$$

Z = Characteristic Impedance

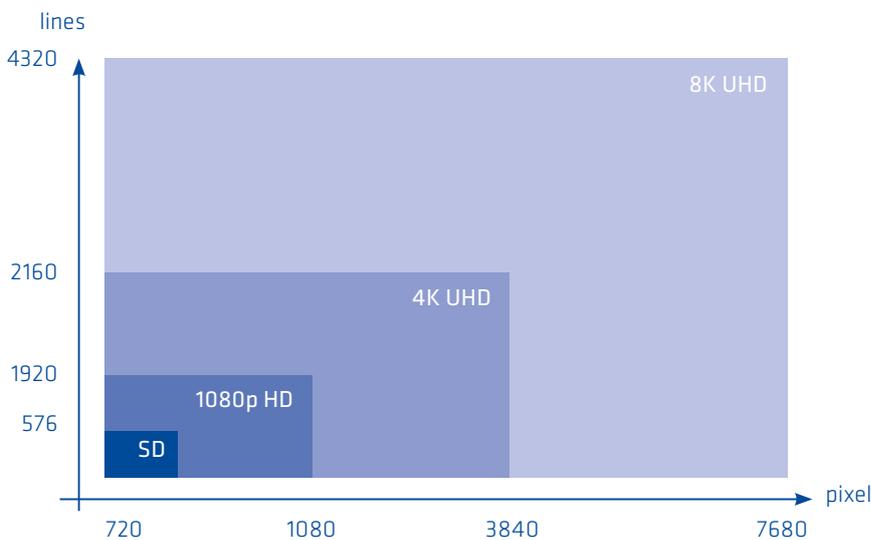

ϵ_r = Relative permittivity of the dielectric

D = Inner Diameter of the outer conductor, mm

d = Diameter of the inner conductor, mm

RESOLUTION 4K

3840 x 2160 progressive scan, the bit rate is 12Gb/s.
The high bandwidth of 12 Gb/s (4 times 3G /1080p) reduces the transmission length dramatically.

Three different 4K solutions for broadcast production are in discussion:

1. Single link (1x12Gb/s, 1/2 clock frequency = 6GHz)
2. Dual link (2x6Gb/s, 1/2 clock frequency = 3GHz)
3. Quad link (4x3Gb/s, 1/2 clock frequency =1.5GHz)

The dual link and quad link solutions will solve the issue with the high bandwidth for new installation. To know the 4K situation of an existing broadcast infrastructure, we have to look at the single solution.

The maximum transmission distances are based on the maximum loss at half frequency mentioned in the corresponding specification. Today's devices use equalizers mainly designed for 20dB loss (see SMPTE 292M and SMPTE 424M). For the technical realization it is essential to check the equipment e.g. equalizers if they are suitable for the maximum values

1. VIDEO CABLES 75 Ω

In the Broadcast industry, the following cable constructions are used to transmit video content:

- Installation cables: coaxial 75 Ω, foam PE dielectric, foil and braid
- Patch cables: coaxial 75 Ω, foam PE dielectric, two braids

Standard Installation video cables portfolio:

- 041/1.9AF

Today's broadcasters' infrastructure is designed for 720p, 1080i or even 1080p video content. The important question for broadcasters is what will be the future content and will it affect my infrastructure.

For example, the typical infrastructure of an outside broadcast truck is the coaxial cable 0.6/2.8AF. For a stadium it is the coaxial 1.4/6.6AF or 1.6/7.3AF.

Video content 1.5G:

The HD-SDI signal is defined by SMPTE292M. This content is like the SDI signal an uncompressed component signal, serial transmitted via one coaxial cable. The resolution of 1080i is 1080 lines x 1920 pixel. The resolution of 720p is of course 720 lines x 1280 pixel and the bit rate is 1.485Gbit/s. Based on the SMPTE 292M specification a maximum transmission distance of an 0.6/2.8AF is 70m plus a headroom. Practical tests showed 90m.

Video content 3G:

The HD-SDI signal is defined by SMPTE424M. The resolution is 1080 lines x 1920 pixel, the scan is progressive; the bit rate is 3Gbit/s. Identical to SMPTE292M, the maximum transmission length is specified at maximum 20dB attenuation at half clock frequency. Based on these key points, the maximum transmission distance of a 0.6/2.8AF network is 47m plus headroom, practical test 80m.

Looking at the next generation of possible video contents we would like to look at 4K.

2. UHD VIDEO CABLE 75 Ω

[Draka coaxial cable for transmission of 4K signals](#) [Coaxial cable goes 4K](#)

There is currently a discussion on higher data rate on the market. 4K is playing an ever-increasing role in this. Currently, 4K transmissions in Quad Link (4 x 3 Gbit/s) are carried out for technical reasons. In practice, however, this proves to be uneconomical. Single-link transmission at 12 Gbit/s should be aimed for.

According to SMPTE ST 2082, the 4K format transmits video signals with a resolution of 3840 x 2160 pixels. Data transmission takes place with a rate of 12 Gbit/s. This corresponds to a half clock frequency of 6 GHz. The standard also provides for a maximum allowed attenuation of 40 dB. Draka has developed coaxial cables for 4K applications based on these specifications. For example, the new UHD series includes the UHD50 and UHD100.

In developing the new series, Draka has placed great emphasis on meeting the requirements of OB truck manufacturers, such as maintaining the outer cable diameters of 4.5 and 7 millimeters. Draka has achieved this through higher dielectric foaming and a silver-plated, size-optimized, inner conductor.

The quality of the components is of decisive importance in the technical implementation. To achieve maximum results, connectors and cables should be matched to each other. Tolerances must be kept as low as possible.

It should also be taken into account that different generations of equalizers are installed in the input board of the devices. These have a significant influence in determining the maximum achievable cable length.

3. CAMERA CABLES

In the Broadcast industry, the following cable constructions are used to connect a camera to the camera control unit:

- Triax cables
- SMPTE311M Hybrid camera cables

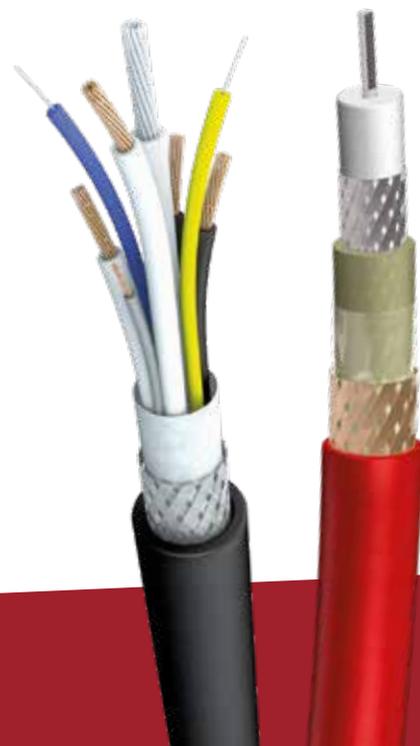

Standard Triax portfolio:

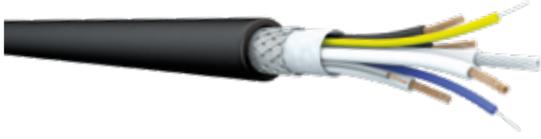

- Mobile use with permanent winding has been proofed robust in the different environments over decades.
- Simple and field mountable connector
- No cleaning of the optical lenses needed

SMPTE Hybrid Camera Cable according to SMPTE 311M:

- Camera cable for HDTV and super slow-motion application
- 2 buffered Single Mode fibres of type G.652.D2 or preferably G.657.A2/B2 BendBright-XS
- Outer jacket options: PU, TPE, LSZH
- Max. transmission using fibres is < 25KM
- Limitation to 2-4Km due to power supply
- Mobile use with permanent winding has been proofed
- Simple and field mountable connector

SMPTE311M Camera Cables

Application

This Hybrid HD Camera Cable 2SM 9/125 + 4 x AWG20 + 2 x AWG24 acc. to SMPTE 311M-Standard contains Single-Mode Optical Fibres, Auxiliary- and Signal Conductors. It is used in professional video productions for simultaneous transmission of energy, video, audio and control signals and is intended to interconnect Camera Units and Base Stations in conjunction with the Connector Interface Standard. It is suitable for all new digital camera systems of well-known manufacturers.

C25: Properties of cabled BendBright-XS Patch Cord fibre; ITU G.557 A2 and G.657 B2**General and Application**

Draka BendBright-XS single-mode fibre combines three attractive features: excellent low macro-bending sensitivity, Draka's revolutionary new ColorLock® XS coating and tight glass geometry. Together they create the ideal performance for all patch cord, interconnect & jumper applications.

4. AUDIO CABLES

In the Broadcast industry, the following cable constructions are used to transmit audio content:

- Microphone cables: stranded copper wires AWG 24/7
- Mobile Audio cables for Stage and outside Broadcast application
- for inside use / application in a studio, TV station and stadium

Microphone cables portfolio:

- Micro 22
- XLR PRO FLEX

More designs on request or in the Music Industry (MI) catalogue

Mobile Audio cables:

- AC10 SP 24/7 nxP
(High Flex Multicore audio cable with a stranded innerconductor)
- AC10 SS 24/7 nxP
(Flex Multicore audio cable with a stranded innerconductor)
- Digitalsound
(Multicore audio cable with a stranded innerconductor and PU jacket)

Installation Audio cables:

- AC10 SS 26/7 nxP
(Multicore audio cable with a stranded innerconductor for studio environment)
- AC10/SS 23/1 nxP
(Multicore audio cable with a solid innerconductor for long distances, mainly for stadium environment)

Multicore Audio Cable AC10 SS23/1 x pairs

For Installation

Application

Audio cables are used in professional broadcasting systems for the transmission of analogue and digital audio signals.

Standards

Basing upon ARD-Specification and acc. to AES/EBU-Recommendation.
FRNC-C, IEC 60332-3-24, CPR class: D_{ca}

Construction

Conductor	solid copper wire, bare $\varnothing = 0.56$ mm (cross section 0.26 mm ²)
Insulation	Foam-skin-PE , diameter 1.4 mm
Pair stranding	two cores twisted to the pair
Pair identification	a - core: white, b - core: blue (the above colours in regular intervals)
Pair screen	Al-PET-foil, Aluminium outside $\varnothing 2.9$ mm + solid copper drain wire, tinned
Pair insulation of the one pair cable	PET-foil
Overall screen of the one pair cable	copper braid, tinned
Pair sheath of the multi-pair cables	halogen free, flame retardant copolymer
Colour and identification	grey RAL 7001 with number printing
Sheath	LSOH, FRNC, grey RAL 7001

Application

Control cables are used in professional broadcasting systems for digital signals, like AES/EBU audio

Standards

AES/EBU; IEC 60332-3-24
Cpr class: B2_{ca}

Construction

Conductor	stranded copper wires, tinned, AWG24/7, (cross section 0.22 mm ²),	Ø 0.6 mm
Insulation	Foam Skin PE	Ø 1.2 mm
Twisting	2 cores to the pair	Ø 2.4 mm
Pair colour	white, blue	
Pair screen	Al-PET-foil, Aluminum inside + stranded copper drain wires, tinned	
Overall screen	Copper braid, tinned	
Sheath	FRNC-C, black, RAL 9005	Ø 6.0 mm
Printing	DRAKA Digital control cable FRNC-C - AES/EBU - 110 Ω B2ca s1a d1 a1 <CE> batch number + meter marking	

Mechanical properties at 20°C

Bending radius	without load	≥ 4 x D (D= outer diameter)

INDEX FIBER CABLES

Central tube cable with 2-24 fibers based	70
Cable for mobile use with tight buffered fiber	72

6. FIBER CABLES

- Installation cables:
The cable is water-blocked and well suited for installation in ducts and on trays indoor and limited outdoor use in ducts

Standard Fiber Installation cables:

High bit Media Transport over IP Networks SMPTE ST 2110

The broadcast signal is transmitted serially, line by line, frame by frame. Each line and each picture has sync pulses (V and H). In addition, the audio channels and auxiliary data are transmitted. The actual video signal is uncompressed in 4: 2.2 / 10bit. The networks have been designed as coaxial cable in 75 ohms for years.

The **SMPTE ST 2110** is a standard of the Society of Motion Picture and Television Engineers (SMPTE). This specifies the transmission of uncompressed digital broadcast signals (video stream) over an IP network in real time. Each record (video, audio, data) is synchronized with each other without affecting the records. They can be routed and edited separately, as well as metadata such as timecode, subtitles and teletext assigned to the records.

The application: The pioneers of media transport of native HD signal over long distances were the hosts of big events, like for big football tournaments, Olympic and wintersport events.

The **IP MediaLine Fiber Cable Series** based on **SMPTE 2110** is designed for installation in the studio, stadiums and event of the broadcast sector.

IP MediaLine Fiber on SMPTE 2110 Central tube cable with 2-24 fibers based

Application and installation

This cable can be used to send digital video over an IP network, fiber to business and fiber to the building drop connections as well as fiber to the home drop and access connections. SMPTE 2110 is a standard from the Society of Motion Picture and Television Engineers (SMPTE) that describes how to send digital video over an IP network.

Non-metallic unitube cable is with gel-filled tubes and water-blocked design.

With its FireRes® sheathing this cable is ideal for indoor installations.

It is CPR Class Cca cable with very high flame retardant performance.

It has glass yarn dielectric armouring for rodent resistance.

The cable is water-blocked and well suited for installation in ducts and on trays indoor and limited outdoor use in ducts.

It is equally suited for installation in ducts and on trays.

It has a degree of rodent protection.
