IMAGING IN PATIENTS UNDERGOING TAVR

Role of various imaging modalities
before, during and after
TAVR procedure

Role of **echocardiography** relative to
other imaging modalities
in TAVR cases

IMAGING IN PATIENTS UNDERGOING TAVR

BEFORE
TAVR
Procedure

ECHOCARDIOGRAPHY

: Primary means of establishing diagnosis, severity and subtype of aortic stenosis
: Secondary means of TAVR valve sizing

CHEST CT

: Primary means of TAVR valve sizing

DURING
TAVR
Procedure

ECHOCARDIOGRAPHY

: Primary means of assessing for paravalvular leak, overall valve function and possible complications.

FLUOROSCOPY / CINE

: Primary means of AVR valve implantation guidance

AFTER
TAVR
Procedure

ECHOCARDIOGRAPHY

: Primary means of assessing for prosthetic and overall cardiac function.

Echocardiography Prior to TAVR

ROLE OF ECHO PRIOR TO TAVR

- Establish whether indications for TAVR are present
 - Severity of aortic stenosis
 - Subtype of aortic stenosis (high vs. low-gradient)
- Asses LV ejection fraction
- Assist in TAVR valve sizing

Types of Aortic Stenosis

Severe Aortic Stenosis | TTE Apical 3-Chamber

Severe Aortic Stenosis | TTE Apical 3-Chamber

Severe Aortic Stenosis | TTE Apical 4-Chamber

Severe Aortic Stenosis | TTE Apical 5-Chamber

SEVERE AORTIC STENOSIS

Continuous Wave (CW) Doppler

AORTIC VALVE

VTI = 134 cm
 Vmax = 4.3 m/sec
 Peak/Mean Gradient 74/43 mm Hg

Pulsed Wave (PW) Doppler

LVOT

VTI = 24 cm
 Vmax = 0.8 m/sec
 Area 3.14 cm²

Dimensionless Index = $24 / 134 = 0.18$ | Aortic Valve Area = 0.6 cm²

SEVERE SENILE CALCIFIC AORTIC STENOSIS OF A TRILEAFLET AORTIC VALVE

	Severe Aortic Stenosis	Our Patient
Peak velocity (V_{max})	≥ 4 m/sec	4.3 m/sec
Mean gradient (ΔP_{mean})	≥ 40 mm Hg	43 mm Hg
Dimensionless Index	≤ 0.25	0.18
Aortic valve area (AVA)	≤ 1.0 cm ²	0.6 cm ²
AVA Index	≤ 0.6 cm ² /m ²	0.3 cm ² /m ²

Echocardiography During TAVR Procedure

Question | Echo Type

Should I use **transesophageal** echo (TEE) or **transthoracic** echo (TTE) during TAVR procedures?

Recommendations for Comprehensive Intraprocedural Echocardiographic Imaging During TAVR

Rebecca T. Hahn, MD,* Stephen H. Little, MD,† Mark J. Monaghan, PhD,‡ Susheel K. Kodali, MD,* Mathew Williams, MD,§ Martin B. Leon, MD,* Linda D. Gilam, MD, MPH||

ABSTRACT

Recent multicenter trials have shown that transcatheter aortic valve replacement is an alternative to surgery in a high risk population of patients with severe, symptomatic aortic stenosis. Echocardiography and multislice computed tomographic imaging are accepted tools in the pre-procedural imaging of the aortic valve complex and vascular access. Transesophageal echocardiography can be valuable for intraprocedural confirmation of the landing zone morphology and measurements, positioning of the valve and post-procedural evaluation of complications. The current paper provides recommendations for pre-procedural and intraprocedural imaging used in assessing patients for transcatheter aortic valve replacement with either balloon-expandable or self-expanding transcatheter heart valves. (J Am Coll Cardiol Img 2015;8:261-87) © 2015 by the American College of Cardiology Foundation.

These recommendations support the use of TEE for TAVR.

Optimal Imaging for Guiding TAVR: Transesophageal or Transthoracic Echocardiography, or Just Fluoroscopy?

Itzhak Kronzon, MD, Vladimir Jeinin, MD, Carlos E. Ruiz, MD, PhD, Muhamed Saric, MD, PhD, Mathew Russell Williams, MD, Albert M. Kasel, MD, Anupama Shivvaraju, MD, Antonio Colombo, MD, Adnan Kastrati, MD
Section Editor: Partho P. Sengupta, MD

THE FOLLOWING IFORUM DEBATE FEATURES 3 VIEWPOINTS related to the most practical and effective imaging strategy for guiding transcatheter aortic valve replacement (TAVR). Kronzon, et al. provide evidence that enhanced analysis of aortic valve anatomy and improved appreciation of complications mandate the use of transesophageal echocardiography as front-line imaging modality for ALL patients undergoing TAVR. On the other hand, Saric and colleagues compare and contrast the approach of performing TAVR under transthoracic guidance. Lastly, Kasel and co-workers provide preliminary evidence that TAVR could be performed under fluoroscopic guidance without the need for additional imaging technique. Although the use of less-intensive sedation or anesthesia might reduce the procedural time, we need more randomized data to establish the most cost-effective approach in guiding TAVR.

Abstract

Transcatheter aortic valve replacement is increasingly performed as a minimally invasive treatment option for aortic valve disease. The typical anesthetic management for this procedure was traditionally similar to surgical aortic valve replacement and involved general anesthesia and transesophageal echocardiography. In this review, we discuss the technological advances in transcatheter valve systems that have improved outcomes and allow for use of sedation instead of general anesthesia. We describe an anesthetic protocol that avoids general anesthesia and utilizes transthoracic echocardiography for procedural guidance.

NYU TAVR Program | TEE vs. TTE

Sep 1, 2011 – Nov 30, 2016

What to Look For During TAVR on Echo?

- TAVR Valve Function
 - Paravalvular Leak
 - Complications
- 

TAVR | Intraprocedural Echo Evaluation

When..

- Proper preprocedural TAVR valve sizing is done, and
- When newer generation TAVR valves are used,
- By a an experienced TAVR team

... TAVR procedure is typically uneventful

... Complications are relatively rare

TAVR Valve Function

TAVR: Markers of Good Implantation

Valve Shape & Location

- Short axis: Circular rather than ovoid
- Long axis: Proximal end just a few millimeters in the LVOT

Valve Gradient

- Vmax typically < 2.0 m/sec

Valve Regurgitation

- No significant paravalvular or transvalvular aortic regurgitation

If one or more suboptimal, consider:

- **Repositioning** TAVR valve (for self-expanding valves)
- **Post-dilatation** of TAVR valve with a balloon
- **Implantation** of another TAVR valve (valve-in-valve procedure)

TAVR Valve Shape

TAVR Valve Shape

OPTIMAL SHAPE
Circular

TAVR Valve Shape

SUBOPTIMAL SHAPE
Ovoid

TAVR Valve Location

OPTIMAL LOCATION
No excessive protrusion
into LVOT

TAVR Valve Location

SUBOPTIMAL LOCATION

Too deep
into LVOT

Most Common TAVR Valves at Present

TAVR Valve Gradients

Aortic Valve Gradients | Pre & Post TAVR

Before TAVR
(Severe native valve stenosis)

Vmax = 4.3 m/sec
Peak/Mean Gradient 74/43 mm Hg
Time to peak gradient
140 msec (late peaking)

After TAVR
(Minimal aortic valve gradients)

Vmax = 1.4 m/sec
Peak/Mean Gradient 9/3 mm Hg
Time to peak gradient
95 msec (early peaking)

TAVR Valve Gradients

OPTIMAL GRADIENT

$V_{max} \leq 2.0$ m/sec

$V_{max} = 1.4$ m/sec
Peak/Mean Gradient **9/3** mm Hg
Time to peak gradient
95 msec (early peaking)

SUBOPTIMAL GRADIENT

$V_{max} > 2.0$ m/sec

$V_{max} = 2.6$ m/sec
Peak/Mean Gradient **27/17** mm Hg
Time to peak gradient
> 100 msec (late peaking)

Paravalvular Leak Evaluation

1 Month Moderate & Severe PVL

TAVR PROCEDURE | TRANSTHORACIC ECHO

Significant Paravalvular Aortic Regurgitation

POST TAVR | TRANSESOPHAGEAL ECHO

Significant Paravalvular Aortic Regurgitation

PARAVALVULAR AORTIC REGURGITATION POST TAVR

No easy way to grade it

Table 4 VARC II Recommendations for Evaluation of Aortic and/or Paravalvular Regurgitation After TAVR

	Mild	Moderate	Severe
Semiquantitative parameters			
Diastolic flow reversal in the descending aorta—pulsed wave	Absent or brief early diastolic	Intermediate	Prominent, holodiastolic
Circumferential extent of prosthetic valve paravalvular regurgitation (%) [*]	<10	10–29	≥30
Quantitative parameters[†]			
Regurgitant volume (ml/beat)	<30	30–59	≥60
Regurgitant fraction (%)	<30	30–49	≥50
Effective regurgitant orifice area (cm ²)	0.10	0.10–0.29	≥0.30

^{*}Not well validated and may overestimate severity compared with quantitative Doppler. [†]For LVOT >2.5 cm, significant stenosis criteria is <0.20. Adapted with permission from Kappetein et al. (66). VARC = Valve Academic Research Consortium; other abbreviations as in Table 1.

VARC II Criteria
*An expert consensus
 without empiric validation*

POST TAVR | TRANSESOPHAGEAL ECHO

AR occupies > 30% of prosthetic circumference

Consistent with **severe** aortic regurgitation

TAVR PROCEDURE | TRANSTHORACIC ECHO

Pressure Half-time = 63 msec

Consistent with **acute** aortic regurgitation

POST TAVR | TRANSESOPHAGEAL ECHO

Holodiastolic Flow Reversal in Descending Aorta

Consistent with **severe** aortic regurgitation

Echocardiography Post TAVR Procedure

What to Look For Post TAVR on Echo?

Assess for TAVR complications

- Pericardial effusion
 - LV rupture [LV wire related]
 - RV rupture [Pacing wire related]
- Annular rupture

Thank you!

New York University Langone Medical Center

Case #1

Pericardial Effusion Post LV Wire Removal

Prior to CoreValve Insertion

6:49:59 PM
No pericardial effusion

Post CoreValve Insertion But Wire Still in LV

7:23:03 PM
First TEE image of CoreValve

7:26:36 PM
Still no effusion

Post TAVR Insertion, LV Wire Removed

7:31:06 PM
First appearance of effusion

7:39:01 PM
Massive effusion

Case #2

Pericardial Effusion Post RV Wire Removal

Day 0 | Uneventfully implantation of a TAVR valve

No pericardial effusion

Day 1 | Hypotension minutes post removal of temporary RV pacing wire

New hemorrhagic pericardial effusion

Day 1

Hypotension minutes post removal of temporary RV pacing wire

**Mitral Inflow**

 Marked respiratory variations indicative of tamponade

Day 1 | Post Pericardiocentesis

Resolution of
pericardial effusion
