Happy reading!

CONTENTS

01. PREFACE.

How does a contact with the Teacher occur?

02. A unification of astrology with astronomy and physics;

03. Comparison of astronomy and astrology. Why do astrologers use the zodiacal constellations?

04. The basics of eastern teachings about the chakras;
05. Astrological influence is secondary - the stars suppose, but do not force;
06. The sense of astrological influences;
07. Three giant celestial bodies - a comparison of features of their radiation;
08. Zodiacal constellations indicate on the giant celestial bodies;
09. The Sun is a huge fourth celestial body that affects us;
10. What has changed in the sky since the birth of astrology?
11. The main influence of giant celestial bodies and additional;
12. The proof of existence of the celestial bodies ancestors – the Central Celestial Body of the Universe (CCBU), the Nuclei of Super Galaxy and Galaxy;
13. "Esoteric Astrology" of Alice Bailey;
14. On what does the Sun indicate?
15. The detailed adjustments in astrology due to changes in the sky;
16. Two factors on which we should assess the impact of the giant celestial bodies;
17. The features of radiation in areas of the sky of each of the 4 elements;
18. The system of initiations of the 4 elements;
19. An overview of all constellations of the zodiac. Dependence of temperament from the level of disclosure of chakras;
20. Zodiac signs have shifted. And what has happened to their characteristics?
21. The constellations of the element Earth – the Solar Signs of Water (in western astrology - Fire);
22. The constellations of the element Fire – the Solar Signs of Air (in western astrology - Water);
23. The constellations of the element Water – the Solar Signs of Earth (in western astrology - Air);
24. The constellations of the element Air – the Solar Signs of Fire (in western astrology - Earth);

25. Aspirants, Disciples, Initiates, World Servants, World Saviors.

01. PREFACE

HOW DOES A CONTACT WITH THE TEACHER OCCUR?

All books of the series "Esoteric natural science" are created during a meditative contact of the disciple (author) with the consciousness of the Teacher (the Ascended Master Djwhal Khul).

I'll try to describe this process.

I (disciple) tune. I went into a state of meditation, move away from earthly concerns and start to concentrate on the theme that I want to understand and properly interpret for myself. Or just I go into a meditative state and in this state find in my mind "above" something like a mental parcel – some theme, a question that requires a parsing and concentrated consideration. Either this topic is known to me or may be entirely new. I will not know until look at this. A viewing is almost instantaneous. And now I'm in the needed state for work. It's desirable that both the physical well-being is consistent to the high level of a mental-emotional activity. Therefore, slow walks are the most desirable time for such meditative contacts.

If a level of my motivation is high, i.e. it's great the desire to understand the issue – a communication is much easier, and any noise did not interfere.

Such sessions are like telepathic lessons.

The Messages from the Teacher are the thought-packages. They descend to the brain and become a "trigger" to the start of thinking on this theme.

In parallel, I am preparing for them - read books, watch the studied processes and phenomena, visualize, meditate on given topics. Hours and days, hours and days. Even weeks and months were needed sometimes for consideration of a single, particularly difficult issue. I can say that absorption of detailed, basic information on the occult and the various fields of science took me about 4-5 years. There were times,

especially in the beginning when I could not understand many things. I highly strained and suffered when it turned bad.

First 1.5 years there was a kind of automatic writing. I was immersed into the trance state and just fixed on the paper that appeared in the brain. I realized all that I wrote down. However, I realized that it was not completely my thoughts. This period was in some way, a preparatory training. And the most important and interesting began then. During this time (1.5 years), I studied the method of perception of impressions sent telepathically. Thoughts of the Master were very clear, energetic and highly demanding of immediate fixation (otherwise they will be missed, and they will have to be retransmitted). So I went everywhere with pens and notebooks, and constantly wrote what causes surprising and curious glances of provincial residents that by the way did not care me. Let get used to the image of a writer, I thought to myself.

As the assimilation of transferred material, and reading of more and more number of scientific and esoteric literature (more - scientific), I gradually became a full member of the creative process of writing of articles for the books. Together we worked out the language in which it was possible to pass a new terminology necessary to describe natural phenomena and processes exactly from our point of view. I say "our" - in fact, I have long ago become "their", teachers, worker. Therefore, I say "our".

By the end of 6-7-year apprenticeship I am so imbued with the spirit of the new transmitted teachings that could now without a constant control of the Teacher explain most of things happening in the world. Any scientific book became for me truly open, unsolvable issues and problems disappeared. Everything has become absolutely clear. The Laws of Attraction and Repulsion, Transformation and Identification truly run the show in the universe. At least in this universe. If to recognize the nature of these laws then you will understand the meaning of science.

Astrology should not enslave, imposing a particular pattern of behavior, corresponding to the zodiac sign, and prescriptible by the basics of teaching. Its mission is to help understand the prerequisites for human development.

02. A UNIFICATION OF ASTROLOGY WITH ASTRONOMY AND PHYSICS

In this book you will not find multipage describes of the astrological signs. Its purpose is somewhat different. Namely – to subsume under astrology the scientific basis - the physical and astronomical. Scientists do not accidentally fall into this occult science with skepticism and distrust. And how could it be otherwise, when modern Western astrology offers as an explanation of the essence of the zodiacal influence completely illogical facts and conditions. This does not mean that it is not accurate the descriptions of zodiacal signs themselves. No, then they just close enough to the truth. But an interpretation of the reasons why the "stars" can influence a person looks completely unconvincing, and very naive.

Astrologers say that certain emanations coming from stars can influence on a person. Moreover, this effect is so significant that causes differences in the characters and the psycho-physiological characteristics of organisms of people born at different times of the year. But astrologers themselves realize that stars as sources of electromagnetic radiation (photons) are too weak and very far from us, that this radiation can not be taken into account. So this question it is accepted to neatly hush up and sidestep as an acceptable scientific explanation has not yet been proposed.

Here and there - astronomy and physics are separately, and astrology is separately from them. Scientists laugh and do not recognize it for science. Astrologers stoically withstand criticism often not paying attention to it and continue to believe the tenets of their teaching.

But it can not continue further. Both sides lose more due to the lack of association of both areas of human knowledge. The truth, as

always lies in the middle. Astronomy and physics can learn a lot of valuable information from the analysis of the astrological postulates. Astrology, in turn, is in dire need of a scientific basis, which will turn it from a mythological discipline into the academic.

Astrology, without scientific evidence is recognized and used by most people in the world. If we rationalize the meaning of its effects, then it'll get a powerful reinforcement in the face of figures of official science.

Synthesis of science and occultism is needed, and for that we are here and write this book.

Let's get down.

03. COMPARISION OF ASTRONOMY AND ASTROLOGY. WHY DO ASTROLOGERS NEED THE ZODIAC CONSTELLATIONS?

Let we make a brief comparison between astrology and astronomy.

Astrology like astronomy is interested by the position "in the sky" (on the firmament) of the Sun, planets and other celestial bodies.

Astrologers say about some "stellar influences" to explain existence of psycho-physiological types of people and argue that these influences determine the features of human behavior.

But astronomers (and primarily astrobiologists) if and bind a functioning of human organisms with the influence of the heavenly bodies it is only with the influence of one of them - the Sun. And under the "influence of the Sun" they mean an impact of solar radiation on the processes occurring in the world including the processes that occur in human bodies.

Astrologers are not interested in any constellations apart of the zodiacal, while astronomers pay attention to all constellations.

Also astrology uses a classification system of 4 elements that ancient Greeks used to describe and enumerate the basic elements of the

universe. In astronomy of course such classification does not exist. And we'll try to explain why not.

It is surprising but that astrology gives us very valuable information about the structure of the universe.

Initially it directs at reflexions the attention that is paid in astrology the zodiacal circle as well as a three-fold repetition in the zodiacal circle of each of the four elements. And this repetition does not occur in random order. Between each of two identical elements all other three elements are arranged and their order strictly repeated. For example, in the zodiacal circle there are three constellations related to the element "Earth". Between each two constellations of element "Earth" the constellation of three other elements are located. At the same time they are always placed in the same order: after "Earth" should be "Fire", then "Water", then "Air" and nothing else.

Thus, in the zodiacal circle we can observe a strict sequence of location of the elements:

Earth, Fire, Water, Air, Earth, Fire, Water, Air, Earth, Fire, Water, Air.

Virgo, Leo, Cancer, Gemini, Taurus, Aries, Pisces, Aquarius, Capricorn, Sagittarius, Scorpio, Libra.

If you follow it clockwise (but it is the way it should follow in the future, we will explain why).

Astrology originated in ancient times. And in the case of any other science the Teachers of the Ageless Wisdom help people to create it. Or rather it was created by the Teachers and then telepathically transmitted in the form of mental images to the people who were most susceptible to their spiritual touch.

In ancient times there were neither telescopes nor metric systems. Therefore, to estimate distances on a cosmic scale ancient astrologers used not meters, kilometers or light years like it is now. This purpose it served the classification of 4 elements.

The zodiacal constellations themselves on Earth and on any other celestial body of our solar system have virtually no influence. The distance between us and the constellations are too large to celestial

bodies of the constellations or the celestial bodies of our solar system could "feel" an impact of Attraction Fields each other. And streams of elementary particles emitted by the stars are too quickly absorbed by the space environment to somehow affect (to heat) celestial bodies that are part of another solar system. Therefore, in reality the zodiacal constellations - it is nothing like a milestone indicating the position of the Earth and other planets on the solar orbit. Projection on the zodiacal constellations gives accurate information about where on the solar orbits is one or another planet.

04. FUNDAMENTALS OF EASTERN TEACHING ABOUT THE CHAKRAS

The human body is not just a physical body. This is an amazing synthesis of different plans of the universe. Only a dense body we can see by usual vision. However, it is surrounded and saturated by particles of fine, sparse shells. We do not see them when we are in the "normal" state. And only a transition into an altered state sometimes gives such opportunity.

There are 7 Plans, six simple and one complex. And all they can be presented within a human body. Usually only bodies of Mahatmas (Great Souls in Sanskrit) combine the maximum number of plans. In the body of ordinary human no more than four coexist - Physical, Astral, Mental and Buddhic.

Each plan has levels - lower, middle, upper.

Particles of the Physical Plan are grouped into the smallest conglomerates - chemical elements. The closer to the core of a chemical element, the lower is sublevel of the Plan, the farther - the higher. As part of each sub-level there are particles as Yin and Yang.

Any chemical element can be destroyed and cease to exist as a whole entity. Externally such destruction manifests as radioactivity.

But usually the particles from the nucleus do not leave the chemical element. However, this occurs with peripheral constantly.

They are released emitting as heat and light, passing from one element to another. This process takes place continuously and at this very moment too in all the bodies around you, and in yours too. Particles of upper sublevels of the Physical Plan easily circulate in the universe.

Thus, each chemical element - is that on the East is called chakra. The faster the chakra gives and receives particles, the more is the speed of such transmission of energy, the higher the level of its "openness" - the more it is opened, speaking the language of occultism.

A chemical element - this is the simplest version of the chakras. There are many variations of them. In the human body there are many. The higher the plan is the bigger and larger scale they become.

Another name for them is energy centers.

Astral Plane particles are concentrated in the nucleus of every cell and around it – they surround DNA. Totally they form the astral body of the organism.

The particles of the Astral Plan are in constant motion and an interchange with the outside world. They take in their community the particles from outside. And also, in their turn, they leave this conglomerate of particles going outside, somewhere else.

We can assume that the core of each cell on the subtle levels represents an energy power center - a whirlwind of moving particles surrounding the nucleus. In other words, it is the same chakra, but of a different scale. The next step on the evolutionary ladder of development. A vessel of life that contains information about the cell and communicating with the outside world.

Starting from the Mental Plan, the chakras are located is relatively nerve plexus and endocrine glands of the body - are saturated, envelop it and nourish them. Each chakra - it can be said, a "place of attaching" of the Mental body of a certain level, one of the mental shell. Particles of this Plan form cycles in the body in thin areas. Mental chakra like astral provide a communication of the mental body in the composition of this organism with the environment. In this they resemble the astral chakras, and not only - the chakra of any other plan.

Do not forget that each particle is a source of information, its carrier.

A mental human body is a self-conscious entity that purposefully absorbs particles from the outside world of the same plan in general, and gives the same from itself into external environment. We say "in general" because the chakra absorbs the particles and other plans. The decisive factor here is features of information recorded on these particles. Just generally, on the Earth there is still a specialty of Plans – i.e. each of them is a bearer of a certain type of information. There is the mineral kingdom, the vegetable, animal, human and superhuman.

Chakras communicate with the body through the nervous system, through the transmission of nerve impulses. It is a faster, but also a more fleeting way. There is still a humoral - impact on the body's metabolism by synthesizing special chemicals - hormones, which carry information about this subtle body - this chakra.

The closer such energy center is to the head, the higher is the level of the Mental Plane of its constituent particles.

Do you remember that all plans are divided into levels? This is natural. So there was a process of evolution. Initially the lower joined, then the upper. It's always in the universe.

Exactly the same separate, independent entity is the body of the Buddhic Plan. What we call our soul, our "I". It saturates, envelops and nourishes the upper parts of the brain corresponding to the cortex. The chakra of the Buddhi-shell is situated about the place where there is the pineal gland. Thanks to epiphysis the human soul can affect the body by the humoral way, with the help of hormones. This method is the most durable and stable compared with the sending of nerve impulses.

As it is amazing! Nothing is constant. Our physical body is all the time updating its consist. Food enters through the mouth, is digested, and then molecules are destroyed in the course of respiration and are output through the lungs in the form of carbon dioxide and water.

And other shells that are the part of our body - thin - also represent channels, absorbing and emitting particles.

Although everything is not so easy. *Chakras can be open or closed*. The opened even as represent the channels - they exchange the particles with the environment. But closed chakras "stew in their own juice". They have little communication with the outside world and they have a constant composition of the particles. However, there are not absolutely closed centers. Any of us represents an "energy pipe" - even if it has a very low rate of flow.

As already mentioned, thin bodies absorb and emit the particles selectively – i.e. able to control the quality and quantity of energy passing through them.

Now, we hope you at least have a little idea how multifaceted, complex and complex creature is a man.

So many kinds of shells - ethereal, astral, mental, buddhic are combined in us. And superhumans also have atmic and monadic. How many different types of energy any individual can radiate – different and qualitatively and quantitatively. Let you not confuse by the word "energy". An individual radiates desires, emotions, thoughts, ideas and images. Each plan has its own specifics of emitted and absorbed energy.

There are thought-flows of different quality and information content. And you can feel them - as they pass through you. Thoughts pass through the head (for the higher levels of the mental) or ideas (for saturating of the Soul). Primitive feelings and emotions (for the lower levels of the mental and higher astral plan) go through the nerve centers and plexus below the head. So there is a saturation of thin shells.

Chakras are the sense organs. With their help we get information from the outside world, from the subtle plans. The known for us sense organs tell us information about the Physical Plan - vision, hearing, taste, smell and touch. A chakras carry information from the astral, mental and buddhic Plans.

The Universe, our God wants the particles everywhere interacted with each other, freely penetrated into every corner of the space. In order to there were no obstacles to the free flow of energy. In order to there were no congestion and blocks. This is love in action. All is combined, all is one, and there are no separate locations. The main purpose of the

Creator for this Mahamanvantara - to make so that energy (spirit) from the sixth of the bottom and to the second of the top, of the monadic, Higher Plan, reaches without distortion to the lowest, physical. And moreover it should happen everywhere in the universe. Currently this is not yet observed. Plans are still very segmental. *It is necessary that the energy – information of the Higher Plan will become the guiding principle for ABSOLUTELY all Plans. Then there will be peace in the universe, harmony, beauty, love. It is necessary that the God, the Silent Witness, as it is called, felt that information of the highest Plan is dissolved in the lowest, and not distorted by any "impurities"*. It is need that the highest Plan, the Spirit, has teamed up with the lower, with the Matter. The Highest Plan does not carry the seeds of evil – it is deprived of all that murderous and heinous that we can see here, in the realm of dense matter. This means that this Plan's the most clean and bright. Energy emitted by its particles bears only love and light.

We hope now do you start catching intention of the Creator? It's to combine all the plans, and to make everything as a single organism. Everywhere there is only light, love and beauty.

05. ASTROLOGICAL INFLUENCE IS SECONDARY – THE STARS SUPPOSE, BUT DO NOT FORCE

Our bodies are under constant influence from the particles emitted by celestial bodies. Changing the location of our planet on orbit around the Sun, as well as projections of the planets of the solar system on the Nuclei (we speak about three giant celestial bodies, read further) and passing by the planets through them streams of particles emitted by these Nuclei, and thus having an impact on the quality of the radiation, all of this together creates in the atmosphere of our Earth a certain energy background. In different seasons, at different position of the sun and planets in the sky the quality of energy (electromagnetic, electric) field of the planet changes. And we all feel it by ourselves. And our bodies adapt. Hence differences in psycho physiological characteristics

of people. Nuclei of the galaxy, Super galaxy and the Central Body affect us. Anyhow - because our star is generated by them, and their own part.

However astrological influences are still secondary. They create the preconditions for the development of the energy centers of our bodies. But we can not fully explain human nature and all that happens to it only by this impact. Professional astronomers have understood it long ago and do not risk to give hundred percent forecasts, using the well-known phrase - "*Stars suppose, but do not force*". Physiological characteristics of a person are subject to the individual himself. And it's necessary to start, first, on the hereditary information, that influences on the structure and development of the physical and astral bodies. A child grows and it occurs in a particular environment. Every moment hundreds and thousands of all kinds of external influences leave their marks on his (her) thin bodies, making changes. And the mental shell and the body of the soul are continually transformed. External visible and invisible effects can so cardinaly affect a person in the course of his life, that he would be totally different from his parents. Not only internally, but even externally.

So when in the future you will read with delight the horoscope, and will be based on these projections your life, remember that you are primarily the owners and masters of your destiny. And it's not an allegation. "Stars" affect. But do not govern. They create the background, mood. But the main tuner of your life is you.

Currently astrology has become for many something like religion. The tool for studying the lives and characters. Many people, after reading a lot (or not) books on astrology, look at others and think that knowing their zodiac signs, can fully explain all their properties and features.

Believe us, it is not.

Percentage of accuracy of astrological predictions depends on many factors. We can trace it to the following regularities.

The more spiritually a person is developed, the less suitable for him descriptions of astrologers become, quite accurate for other people

with the less open upper chakras. More can be said that in general, the younger is the person, the better fit for him horoscopes and forecasts compiled for some zodiacal sign to the total mass of the people. With age most often there are observed deviations from prescribed standards. Although during the aging of the organism one or another rollback to a previous state may occur, as the wear of the body reduces the openness of chakras. But this is not an absolute rule.

Likewise, you can develop and lower chakras. You can make healthy the weak body, strengthen by hardening.

The person can cardinaly metamorphose the character and the body during the life, completely change the astrological prerequisites obtained at birth. Fully disclose all chakras. And no one can say with certainty what is his (her) zodiacal sign.

Astrology is intended not to enslave the human with the help of imposed standards of behavior supposedly relevant the zodiacal constellation. Its mission is to help you to understand the basics, received at birth. In order that the person will know in which direction he should develop, and what gaps eliminate. Do not forget that the goal of any is the harmonious development of all the chakras. But in this case, the development of higher is a special value. Because without them man is not a man – i.e. not a highly moral, intellectual and spiritual being.

06. THE SENSE OF ASTROLOGICAL INFLUENCES

We do not accidentally start the book with the presentation to your attention the basics of the eastern teachings about the chakras. What guided us in this you will learn in the future.

And now we turn to astrology.

Why is there such science?

What is the basis of astrological influences? What affects us? What is the material carrier? If it is particles, then to what Plans do they belong?

As it is surprising, but the basis of astrological influence is the usual physical and astronomical mechanism. The main actors here are the same - the elementary particles and the celestial bodies, as well as forces that they possess – of attraction, repulsion, inertia, pressure - and by which they effect on other particles and bodies – i.e. on us.

But there is another factor to be taken into account. We should consider this mechanism not only from the naked, scientific point of view, but also from the esoteric. This side of the explanation is ensured to that every elementary particle is a carrier of information. This is a source of that what is called on the East as karma. It has a memory. Now this fact is not known to scientists, but someday it sure becomes an integral part of the scientific worldview. Although it will be quite different science - esoteric.

We do not accidentally start this book with a story about the mechanism of action of the chakras.

A chakra is an energy center, one of the shell-bodies forming the organism - this is a ***channel***. The channel that transmits energy through itself, absorbing and emitting.

The meaning of astrological influence on us - is the impact of elementary particles emitted by celestial bodies. Particles reach us, our bodies, penetrate into the substance of our bodies, and create a channel.

Absorption of particles occurs by two principles.

1) ***Blindly, under the action of gravity.*** This occurs mainly from the side of the chemical elements. Although the particles with Fields of Attraction is composed of all plans, not just physical. But it is the chemical elements - these are the main centers of gravity in any organism.

2) ***Selectively, by purposeful selection of the desired particle quality.*** That's how all subtle bodies work in the composition of a living creature. In this case, the selection occurs on the basis of needed information. If the particle carries a needed informative basis, it is absorbed by the chakra, if it does not - repelled or removed if it accidentally was swallowed.

And already in the body is a process of selective separation of information flows. This means that no matter what chakra has absorbed one or another particle, it will be further sent to the appropriate information department

Usually the particles of the lower Plans are absorbed by the lower chakras, and of the top - by the top. But this is optional. If information saturation of the particle attracts the upper chakras, it will be taken up there, upstairs. This is the "Ascension of the Matter to Heaven". In a quarry of everyday experience mason (the top shells of the human body) selects to itself the best material, "marble", and weeds "granite" down. Such way there is constructed the Paradise on the Earth.

Also it takes place the opposite phenomenon. If information corresponding to the lower Plans is written on the particles of the high, they do not go up but to down. "The Dive of Spirit into Matter". And this is the road to hell, figuratively speaking.

It should be noted that blind obedience to the law of gravity takes place mainly in the lower chakras. In chemical elements it is most strongly expressed. Although and they have the ability to choose among the general flow that they need. But their attraction is too large to delete unnecessary by themselves.

In the energy centers of the lower levels of the Astral Plan, which focus in the nuclei of every cell, the ability to selective absorption and sifting is much higher. And a will-less submission to the gravity on the contrary is more weaken.

And the higher is the level of chakras, the more selectivity is pronounced, and to a lesser extent - the blind subjection.

And here we just start to combine the teaching of the chakras with the basics of astrological influence. This teaching will give us invaluable help in this. We will say otherwise - and only this can really help us.

The particles of the 4 directed above plans are moving through the space emitted by each of the three Giant Celestial Bodies, of which we'll talk in details hereinafter. The Physical Plan, the Astral, the Mental, the Buddhic. And there is not only of these, but of the two highest Plans - Atmic and Monadic.

They reach our planet, and penetrate its substance. Our subtle bodies, our shells selectively absorb them, passing through themselves. ***And by such way there is an opening of the chakras. The particles of each concrete quality reveal their own power center. Each of the plans makes to rotate - lose and take particles – the chakras that are responsible for them.***

Naturally, the larger is the number of particles of one or another quality comes to the planet and passes through it and the creatures living on it, the faster the corresponding chakras rotate, and the more they are open.

If within one year the composition of incoming to the planet radiation changes, so does the degree of opening of the chakras of a different type in the organism.

If the percentage of the particles of the higher Plans decreases - the most upper chakras less open. Accordingly, the spiritual development of the human (or of any other creature) is less stimulated. This percentage increases - and evolutionary progress increases.

A significant amount of radiation of the lower Plans contributes to the opening of the lower chakras, including astral (cell nuclei) and physical (chemical elements).

The ration of openness of various types of chakras in the body determines the peculiarities of human nature (or living being).

Do not forget that only 4 Plans represent the human body - Physical, Astral, Mental and Buddhic. Therefore mainly Mental and Buddhic are the higher for us. Physical and Astral are the lower. Although, of course, the particles of Atmic and Monadic Plans also can affect us, but it needs a special development for this. And appropriate slim bodies in humans are still not present. So, people can not purposefully absorb specified types of radiation.

However, "the astrological influence" can only help or impede, but in no way completely determine. "Stars suppose, but do not force". Total development of the human depends on many factors, in the first turn, on his own goals and intentions.

Particles coming to the planet pass through the body of the child and from the moment of the birth accustom him to a certain degree of openness of the chakras. Changes of the qualitative and quantitative composition of radiation during the year lead to changes in the development of the respective energy centers. The body adapts quickly, and such state becomes a natural. And in the future, it "considers" it the most optimal for itself - familiar, native, and the most habitual.

Then in the course of life a person experiences all new influences that may adjust these initial basic settings. Like the powerful energy external influences, the environment in which we are upbringing. And development of the organism, activation of the energy centers in it. All this will change the initial impetus. And maybe even almost drown it out. Previously open chakras can close. Or vice versa - closed or underdeveloped will become stronger, open.

However the trace obtained at birth, will stay once and for all. That's why astrologers with experience are able to determine the zodiac sign of a human, not knowing the birthday. Influence of the zodiac sign remains for all life. At ones it is more pronounced, because the living conditions are similar to the conditions of birth. At others it is fogged as they grow in a completely different environment. But it still remains.

How does the body try to keep the openness of chakras inherent to its birthday?

Staying in certain circumstances we absorb its atmosphere - literally. We charge by the particles of that quality that are dispersed at this moment around us in the matter and in the air. So that people consciously or unconsciously seek the environment that is comfortable and familiar for them. And in this way they pump into their thin bodies the energy of required quality. Some people most of all appreciate the joy of earthly life - and they select from the total energy flow emotional images. Others are more interested in the mental side of occurring in the universe processes and phenomena. All sorts of logical problems and challenges - that is their path. But others have already risen to the level of awareness of the highly spiritual presence in the world of ideas. Astral-mental relationships do not satisfy them in full. Accordingly,

each of these types of individuals will select from the ambient energy-informative field that need for him (her). And this needed for him is sealed on elementary particles. Therefore, absorbing particles we absorb information.

This is a very broad theme – what and how stimulates and nourishes our chakras, and we will not dwell on this here. We only say that any contact lead to this - visible or invisible, conscious or not.

07. THE THREE GIANT CELESTIAL BODIES – A COMPARISON OF CHARACTER OF THEIR RADIATION

But what celestial bodies emit particles that so affect us? What kind of particles? What is their quality?

Let's look at these moments.

The particles affect on the Earth and its inhabitants (us).

Either this is the particles emitted by the Sun. This is primarily photons, i.e. the particles of the Physical plan. The particles of other Plans are also present, but in much smaller numbers (so they do not yet registered by devices).

Or the particles affect from outer space that is located outside our solar system.

Three most powerful sources of radiation for the Earth (external to the solar system) – are the Nuclei of our Galaxy, our Super galaxy and the Central Celestial Body of the Universe. The light they emit contains particles not only physical, but also all other plans. Moreover, the higher the percentage of radiation of the higher Plans increases with the growing of the scale of the celestial body.

Particles of any plan, getting into the heavenly bodies, are heated due to the effect of *Transformation of the Quality by gravitation*¹ (see note below) (mainly in the composition of celestial bodies there is the transformation by gravity). And if they are heated, then begin to move from the center to the periphery. And in the course of this they can overcome the attraction of this celestial body and be emitted by it, and

start to move coasting from it. Moving by inertia the particles reach our planet. And here they nourish our dense shell and subtle bodies. These thin shells and include information about who we are. From them and depend on what shape and appearance the physical component takes. So the impact on them of the particles arriving at the Earth is very important.

¹ - «*Whenever an excessive amount of external Ether enters in a particle per unit of time, Transformation of the external manifestation of its quality occurs.*» (T. Danina, "Ethereal Mechanics" - <http://www.amazon.com/dp/B00I8KSY8Y>, the article "Transformation (evolution) quality - this rise in temperature").

The energy of the particle is important of course. But it is not the only essence of influence. One of the most important factors is the information component. I.e. what information coming radiation bring. And the higher the plan, the later it was involved in the process of evolutionary stimulation of the lower plans. The less it has what is referred to as "evil", "mother" and "Darkness". Then freer the particles from all that involutional and slows the development of the universe. Such information is vitally important for any celestial body. It is a pledge of its future. It is these particles open the upper chakras of any living being and facilitate its early enlightenment.

The general course of the physico-chemical-astronomical processes that take place in different parts of the universe, at its different levels, at celestial bodies of all kind of scale can be considered the same. In any celestial body thermonuclear fusion and radioactive decay flow - but that's to a word. And all celestial bodies in varying degrees emit particles – of the Physical (photons) and other plans that are part of their chemical elements. The reason of radiation is the heating due to the Law of Transformation. And the qualitative composition of radiation is approximately the same. Although there are differences in the amount of emitted particles (i.e., how many they are emitted per unit of time). Naturally, the bodies of larger size and of higher density emit a greater amount.

In addition, the bodies of larger scale were previously involved in the process of "Diving the Spirit into the Matter" – i.e. of the deposition of the particles of overlying Plans for spiritual enlightenment of lower. Therefore, in the composition of their emissions the percentage of those same, higher planes is more.

A simple conclusion follows – *the Central Celestial Body of the Universe is the most powerful source of radiation of particles of all existing in the universe.* The Nuclei of Super galaxies emit a lesser extent. Nuclei of the galaxies do even less. And so it goes downward. Stars are even weaker emitters. And emission of particle by planets and satellites is all minimized.

And everywhere in the universe the same process flows – involution, the dive of the Spirit into the Matter with the further purpose - "*to ascend it on the Sky*". This means that the particles of subtle Plans are immersed into dense and unite with them into one whole. Any celestial body is involved in this process. It takes place on the planets and the stars, and in the Nuclei of galaxies and Super galaxies, and, of course, in the Central Celestial Body of the Universe.

Everywhere there is a struggle and synthesis of light and darkness, spirit and matter. And we can assume that this "*Great War in Heaven*" has the strongest, powerful character in the first place, namely in the Central Celestial Body. And first of all thanks to its huge attraction - gravity. That makes it easier dive into it the particles of thin Plans.

Accordingly, once in this celestial body there is immersed more particles of subtle plans, and it emits them more than smaller bodies, for example, galactic nuclei or stars.

I.e. we are summing to the idea that *the heavenly body is bigger, the more powerful it is as the source of radiation*, and besides of radiation of particles of different plans.

The Central Celestial Body is located of our solar system at a great distance, as compared, for example, with our Sun or even with the Nuclei of the galaxy and super galaxy. Only because of this we do not feel the full power of its radiant emittance. Whether it is so close to our

planet such as the Sun, the Earth would instantly incinerated, heated to incredible temperatures.

The Central Celestial Body is the farthest from our solar system than others. The Super galaxy Nucleus is closer. And the Nucleus of the galaxy is the nearest to us a giant celestial body of all that exists in the universe. ***Only therefore we can compare the power of emissivity of such disparate in scale heavenly bodies like the Nucleus of the galaxy, super galaxy and the Central Celestial Body. Because the farther then amount of emitted particles reaching us is less.***

However, not everything is so simple.

The overall qualitative and quantitative composition of the radiation is very important for us. And it depends on several factors.

First, let's remember that the particles Yang, i.e. with Fields of Repulsion, are capable to support the movement started in the empty space infinitely. In real conditions the particles Yang do not move by inertia indefinitely. Various forces retard them - attraction, repulsion, pressure. The substance of Cosmos absorbs, other particles with which they are faced repel.

Anyway this type of particles is capable to pass the greatest distance, moving by inertia. And besides exactly these particles have the greatest energizing effect. When they are accumulated in the substance, they increase its temperature and transform its quality in the greatest extent.

Inertial (self-sustaining) motion of particles Yin contrast fades pretty quickly. Yin particles are the heavy material particles absorbing energy. But without them of course all also is meaningless.

Secondly the particles of Yin and Yang usually move together in a single flow. The particles Yin, selecting energy, slow down Yang. And last on the contrary support by their energy the movement of Yin.

Third, any celestial body provides to emitted particles the degree of transformation of a certain value. You can also try to speak the language of science - gives some momentum. The degree of transformation and the quality of the particle depends on the initial speed of the inertial motion. The degree of transformation has a constant

value for each celestial body and depends on the magnitude of its gravitational field. But the quality of all particles is different. More precisely, the most important - is the rate of destruction of ether (energy). And it just gradually decreased in all particles (Yang and Yin) in the direction from the lower plans to the upper.

I.e. than the rate of destruction is less, the higher is the initial, starting speed of the particle.

We are taking you the idea that *the higher the plan is, the greater is the speed the particles begin to move.*

And *the greater is the starting speed, the longer is an inertial motion of the particle.* The greater is the distance it will pass.

Fourth, the greater is the mass of a celestial body (i.e. the greater is its attraction field), the bigger it is, the more particles are the part of it, the greater is the degree of transformation informs of emitted particles. And the higher is their initial speed. And the greater distance emitted particles go before they start to decelerate and absorb by the space environment and celestial bodies.

Therefore *the Central Celestial Body* since it is the most massive of all and besides the furthest from us - it is mainly a *source of particles of higher Plans* - for our solar system, for the Earth and for us.

From there, the most subtle vibrations are emitted, the most spiritualizing influence, transforming our bodies and souls, and lifting up on the evolutionary ladder, in the greatest extent. *This is the Spiritual Cresset.*

It emits a lot of particles of varying quality. But because of the distance between the Earth and this heavenly body mainly particles of the higher plans reach us.

The Super galaxy Nucleus is closer to us and has a smaller mass.

Due to the smaller scale it emits a total not so many particles compared to the Central Body. Percentage of particles of any quality, of any plan is below.

However, the qualitative and quantitative composition of radiation reaching us also depends on the distance, as explained above. The closer, the fewer particles have time to slow down and be absorbed by

the space environment, and this primarily relates to the lower Plans. The lower is the plan, the less is inertial speed. The lower is this rate, the faster the particle stops.

It turns out that in *the composition of the radiation of Nucleus of the Super galaxy the percentage of particles of the lower plans increases*. Moreover in this case we should not take literally any one or two plans. Just in general the percentage changes. The quality of particles increasingly shifted toward materialistic. *Vibrations become denser, less spiritualized*.

Try to imagine. With a decrease in the total number of particles the particle content of the lower plans increases. The percentage of particles of the upper does not decrease, because, as you remember, they depend on the distance in the least extent. But their number is less than the number of the Central Body because the Nucleus of Super galaxy emits less.

And an even greater extent this applies to *the Nucleus of the Galaxy*, to its radiation and to vibration of energies emanating from it. *They are even denser and contain even more of the Material Principle*. And all because the scale of the galaxy nucleus is less and its mass is too, naturally. Thus the total number of emitted particles decreases – of all present therein Plans.

The nucleus of galaxy is nearest to us of the three giant celestial bodies. Because of this, *the content of particles of underlying plans increases as part of its radiation even more – i.e. that in esotericism is called as "Matter"*. In the first turn, we understand by them the physical and astral.

This is very important information, the basis of everything in astrology, and it is desirable to introduce it to your inner eye as best as possible.

Let's summarize.

A total number of particles reaching us from the giant bodies is about the same. *The Central Celestial Body is a source of particles of upper Plans and stimulates the upper chakras. This is an experience of "mountain peaks"*. The chakras of brain work most of all – the head

center, the ajna center and the alta major center (in the medulla oblongata). These are the chakras of the Buddhic Plan and the upper levels of the Mental. They correspond to the human kingdom in its higher manifestations and to the kingdom of souls.

The Nucleus of Super galaxy is the source of particles the middle Plans. It stimulates the development of the middle chakras. ***This is an experience of "flatlands"***. The head chakra, the cardiac and the chakra of the solar plexus. These are the chakra of upper levels of the astral plan and of lower levels of mental. They correspond to the medium developed humanity and to the highly developed species of animals.

The Nucleus of Galaxy is the source of predominantly of the lower Plans, and it develops the lower energy centers. ***This is an experience of "caves"***. Two lower chakras - the sacral and the chakra at the base of the spine. These are the chakras of the average levels of the astral plan. It corresponds to the vegetable kingdom and primitive forms of animals.

Influence of the Sun (as of any star on its planets) can also be classified as a "cave experience". The solar radiation contains predominantly particles of the middle and upper levels of the physical plan. In esoteric they are called ethereal and form the ethereal body of every living creature, including minerals. And the dense material body of the human, animal or plant, its molecules from which it is built, it is also a mineral. So that ***the radiation of the Sun corresponds to the simplest chakras in the universe – to chemical elements and it refers to the physical plan and the mineral kingdom.***

08. THE ZODIACAL CONSTELLATIONS INDICATE ON THE GIANT CELESTIAL BODIES

Now there is the *next step* in our explanations. All of them together should eventually lead you to the understanding of why astrologers attentively learn the projections of the planets, the Sun and other celestial bodies of our system onto the celestial sphere.

Zodiac with its twelve constellations - is nothing more than pointers on the sky.

This circle should be divided into zones. There are three main zones. They correspond to the projection on the three main giant celestial bodies, with which our solar system is related and is determined by it. Any star - is an ejection of matter from the galactic nucleus (which is a celestial body). The number of Galaxies in the universe is unimaginably much, and one of them is ours. Any Nucleus of Galaxy is an ejection of a Nucleus of Super galaxy. The number of Super galaxies is also very, very much. Although it is much less than the number of galaxies. After all the galaxies form a super galaxy, as well as the stars form a galaxy. And any nucleus of super galaxy is an ejection from the Central Body of the universe. But in the center of any galaxy, as well as in the center of any super galaxy is located a dense celestial body - Nucleus.

Astrology should be studied in close connection with astronomy – and this is the only way.

Each of the three zones of the zodiacal circle is projected onto one of the "Nuclei". All 12 constellations can be divided into three groups of four in each. Each group “indicates” on one of the "Nucleus". It indicates on the Nucleus of our Galaxy, on the super galaxy Nucleus, which includes our galaxy, and finally on the Central Celestial Body.

In each of three groups there are constellations of all 4 elements - Earth, Fire, Water and Air.

These four elements form a Cross. “Earth – Air” is one crossbar. “Water – Fire” is another. And besides the cross is formed within each of the zones. The earlier principle, according to which each of the astrological Crosses (Cardinal, Fixed and Mutable) connects the constellations of different zones, now is outdated and incorrect. The Cross first of all should be understood not as the intersection in the literal sense, and as a union of energies. Energies of different qualities are connected in the middle point. This is the crossroad.

In astrology to measure the distance to one of three giant celestial bodies, determining our solar system (and the Earth and everything on

it) it is used the classification of particles according to the elements. This system allows you to know the qualitative composition of the radiation emitted by these celestial bodies and reaching the earth.

The radiation of different quality reaches us depending on the section of the zodiacal circle.

12 constellations - 12 zones of the orbit. Each zone – is a new quality radiation. Because of this difference there are 12 types of human characters and not just of people.

Each sector of the orbit – is a projection on one of the constellations, and simultaneously on the one of the "Nuclei".

Each sector (one of 4 in each of the three groups) belongs to one of the elements.

Within each of the three groups there are 4 sectors corresponding to 4 zodiac constellations, more precisely to the projection on them. And you will find in each of these three groups a repetition of the following sequence - Earth, Fire, Water, Air - if you go in reverse direction (counterclockwise).

Here we'll give you a few outdated astrological scheme without the necessary correction. So it was in the early days of astrology.

Capricorn, Sagittarius, Scorpio, Libra - Earth, Fire, Water, Air.

Taurus, Aries, Pisces, Aquarius - Earth, Fire, Water, Air.

Virgo, Leo, Cancer, Gemini - the same.

1 group pointed on the projection of our Galaxy.

2nd - on the projection on the sky of the super galaxy Nucleus, which includes our galaxy.

3rd - on projection of the Central Body of our universe.

It should be noted that this scheme grouping constellations already a bit dated from the time of Mesopotamia and Babylonia (it is believed that during the existence of these states astrology received the first powerful impetus to its development). ***With corrections the situation will look like.***

Sagittarius, Scorpio, Libra, Virgo - Earth, Fire, Water, Air.

Taurus, Aries, Pisces, Aquarius - Earth, Fire, Water, Air.

Virgo, Leo, Cancer, Gemini - the same.

The group 1 indicates on the projection of our Galaxy.

The 2nd - on the projection on the sky of the super galaxy Nucleus, which includes our galaxy.

The 3rd – on the projection of the Central Body of our universe.

Capricorn – “empty” sign - does not belong to any of the Nuclei, while it is experiencing the “extra” influence from the Nucleus of our Galaxy.

Please note, we are not talking about the Solar Signs, which usually are used in the astrological predictions, but just about the constellations. I.e. just before this we were talking not about those who are born under one sign or another, but about the constellations as signposts in the sky.

In the future, we elaborate on the adjustments that should be made.

If you remember, in the book "**The main occult laws and concepts**" (<http://www.amazon.com/dp/B00IZGDHYY>) we talked about the fact that all particles in the Universe can be represented as the square of 4 elements. Earth, Water, Fire and Air. Earth - destroy a lot of ether, create a little. Water - destroy a little and create a little. Fire - destroy a lot and create a lot. Air - destroy a little and create a lot. Particles of all six plans are divided into small diapasons (spectra). And all of the particles of any such spectrum – diapason - can also be attributed to one of these four elements. Earth, Water, Fire and Air.

Particles, from the heavenly body emitting them, move by inertia - a self-sustaining nature of the movement. They are driven by the force of inertia within them. And it turns out that particles of different elements leave the heavenly body with different force of inertia (and therefore with different speed). The particles Air have the biggest force. The particles Water follow them. Then there is the Fire, and finally the Earth is. The force of a self-sustaining movement of the latter type is the smallest. The difference in the value of the force of inertia is well seen in the refraction of photons of different colors. After all the color – is the quality. The smaller is the force of inertia, the greater is the degree of deviation. And vice versa.

Particles of the Earth during their motion stop the first. Then there is the element of Fire. Then - Water. And finally, the air particles go the longest path.

We hope you have already guessed that herein lies the whole point of the idea of the distance measurement using the classification of the four elements. *The element indicates the distance to a celestial body - the radiation source. It tells us about the quality of those particles that are increasingly slow down, if we are at a given distance from the celestial body.* For example, the zodiacal sign of the element Earth shows that when any celestial body (a planet, a satellite, the Sun or the Earth) is projected onto this sector of the sky, it is the closest to the giant celestial body, the effect of which (radiation) we are considering. Only because of this proximity the particles of the Earth can reach us. In sectors of the sky of other elements they are less because of slowing down and stopping.

An astrological sign of the element Fire means that the distance has increased. And when a planet, the sun, a satellite or the Earth itself is projected onto this sector of the sky, the less number of elementary particles, emitted by this giant celestial body, reaches it. A zodiac sign belongs to the element of Fire because the particles of this particular element at a given distance are increasingly disappearing from the stream of radiation reaching our system. Particles of the Earth element there are in this area and even less.

A zodiacal sign of the Water element means that when any celestial body in our solar system has the projection on it, this body is an even greater distance from one of three giant celestial bodies, whose influence we are studying now. And particles whose quality corresponds to the elements Water, at this distance to our solar system more and more are stopped and are absorbed by the substance of the space environment.

And finally, the sector of the element Air on the zodiacal circle shows us the greatest distance to one of the “Nuclei – grandparents”, whose influence we investigate. The particles of this element - Air -

reach us the most. The particles of others are in a lesser extent. Water, Fire, Earth - descending.

However, we should not think that if any sector of the zodiacal circle denotes a particular element, such as Earth, the particles only this quality will reach us from this part of the sky. No, it is not so. *An element indicates that amount of the particles precisely this quality becomes in the radiation reaching up less and less.*

Blurred the boundaries between sectors are not sharp. One area of the sky gradually turns into another. This also applies to the quality of radiation reaching us. When we enter into a nearby sign, the quality does not change instantly.

09. THE SUN IS THE FOUR GIANT CELESTIAL BODY THAT AFFECTS US

The Central Celestial Body, the Nucleus of Super galaxy, the Nucleus of our galaxy - are not the only celestial bodies that affect our planet by their radiation. Any object emitting particles - is a possible source of influence.

However, the greater is the distance, the less is impact because the particles are slowed down and absorbed by the chemical elements and particles of the space medium.

Therefore in the meaning of the significance of astrological influence the most important thing - it's a combination of power of the source and of the distance from it to our planet. Not the strongest emitter, due to its proximity to our planet, may have an even greater impact than the more powerful, but located further.

Or we match the bodies, different in size and in amount of radiation because they are at different distances. Just this occurs in the case of three causing us giant celestial bodies – the CCB, the Nuclei of Galaxy and Super galaxy.

In the Space there are other super galaxies, but our galaxy is located precisely in this. And the radiation from other nuclei passes such

long distance before it reaches us that it becomes unessential because of the large diminution. The same can be said of other galaxies in the composition of our super galaxy. Their nuclei emit, but because of the distance a very small number of particles has reached us. Therefore, we do not take them into account.

But our star, our sun – is very close to us celestial body on the cosmic standards. And its light is very important. It creates a basic background. Particles emitted by the Sun affect our body like the three giant bodies described above.

And just because it is located in relation to our planet in the center of the system, forcing the Earth to revolve around itself, astrologers did not include it in the number of celestial bodies that divide the orbit by their influence onto zones.

The qualitative-quantitative characterization of the flows of particles emitted by the sun has its own peculiarities.

Stars always because of the small scale and later involvement in the process of evolution, predominantly emit particles of the lower Plans. Most of these are photons – the particles of the Physical Plan. Astral is less. Even less there are the rest Plans.

For this reason the Sun for us - is the source of most material aspect of influence. I.e. it stimulates mainly the chakras of lower levels - the chemical elements and the cell nuclei. It strengthens our physical and astral shells. This is a very important factor because without strong physical and astral shells the life on the Earth would have degenerated long ago. And life – is the most important thing in the universe. The indwelling here in the dense layers promotes enlightenment, disclosure and ascension of celestial bodies. For example, of this planet.

We separately will discuss about the details of the mechanism of action of solar radiation on the human body, and about depending of its development on the quality of solar photons.

 If you remember from the course of astronomy, the Earth's orbit is elliptical. In some areas it comes closer to the Sun. In other it moves away from it. The reason for this phenomenon is not the Kepler's laws

which only ascertain, but do not explain anything. The reason – is the differences in the force of gravity from the side of three giant celestial bodies, of which we have talked a lot earlier.

Where the planet is attracted more, it is rejected at a greater distance. And where it is less - it is closer to the Sun.

1) Attraction of the Nucleus of the Galaxy is the greatest because of the smallest distance to it. That is why, when the Earth moves on the part of the orbit that is closest to it, the planet is most rejected. And the maximum of deviation falls on this sector, projected onto Sagittarius. I.e. where there is projected the center of our Galaxy. **On the calendar at this time there is the beginning of July. And the sun during this period is in Gemini, and the Earth itself is in Sagittarius.**

At this time the total amount of solar particles coming to Earth is the smallest. And, furthermore the percentage is shifted in the side of long-wavelength, i.e. of thinner radiation.

The higher is the Plan, the longer is the wavelength.

The lower is the Plan, the smaller is the wavelength.

The particles of the Physical Plan are the most shortwave. The particles of the Monadic Plan - are the most long-wave.

Within each Plan is too - the higher is the level, the more long-wave this radiation is.

The lower Plan is - the shorter wavelength.

2) Attraction from the Central Body of the universe, on the contrary, is the smallest of three Nuclei. But it is not because of its real mass, and thanks to the biggest distance from it. A distance, if you remember, reduces the magnitude of the force of attraction. This was recognized by Newton.

As a result, during the motion of the planet on the part of the orbit that is projected onto the Central Celestial Body, it deviates less of all.

The less of all it is attracted to the CCB just on the sector of the element Air, which corresponds to reality. Air indicates on the greatest distance in comparison with other elements.

This period witnessed on the beginning of January. The sun at this time is projected on Sagittarius and the planet - on Gemini.

Gemini - it's just a constellation from the group of element Air related to the influence of the Central Celestial Body.

The total number of solar particles reaching the Earth is the largest. The percent of short-waved, i.e. dense, is enlarged. At the same time, the number of long-wave is no less than in the rest time of the year. On the contrary, even more.

From all this we can conclude the following.

In early July, the solar radiation is more long-wave, there are less the particles of the lower levels of the Physical Plan. The particles of the lower levels – are the more dense particles, among of them there are most of all Yin, i.e. absorbing energy and with high velocity. Sun particles are accumulated by chemical elements (on the surface and between the nucleons). Accordingly, the more dense particles are accumulated, the more is the total gravity field of elements, because the density of particles - is a mass. The greater is the density, the greater is the attraction. The less is the dense of the particle, the less is the gravity of the element.

It turns out that in July the body is less dense. The gravity of chemical elements is weaker. Metabolism is faster. The body is more concentrated with energy at this time. And it gets used to this state. Chemical elements are adapted to this, and the body is built taking into account the increased energy. Later, the body strives to maintain such level of energy, and does not suffer from large power loads on the body. Well this is shown by such signs of the zodiac as Taurus (former Gemini), Gemini (former Cancer) and Cancer (former Lion). Incredible operability – they can work both day and night, and at the same time smile.

But in early January the picture is opposite. The solar radiation becomes more saturated by shortwave particles – i.e. denser. "Assimilating" by chemical elements, they increase their gravity. Bonds between elements in the molecules become stronger. The body is compacted, its strength increases. But metabolism slows down, because the lower is the level of energy, the higher is the viscosity of liquids, and

molecules move more slowly through the body. The body adapts to this state, and in further "considers" it as normal.

The physical human body is determined by the quality of solar energy reaching the planet at the time of birth of the individual. The energies of different quality caused the development of the physical body of the child throughout the period of its prenatal development. The brain is formed the last. Just the month, when it occurs terminating before the birth formation of the brain, as well as immediately after birth, and of course, the first breath and beginning of the breathing period, and becomes a leading factor in determining the overall level of metabolism in the body. This is formed the program for life.

The main source of solar photons for our bodies - is the oxygen coming with the breath. Photons are accumulated in its surface layers. And with every breath oxygen enters into the body and gives these photons to the iron of hemoglobin. And it, in turn, transmits them to the respiratory chain of enzymes on ATP. Accumulation of energy by the molecule ATP converts it first to ADP and then to AMP. ***When photons are not moving by inertia (the speed of light), they are transferred from element to element under the action of gravity, and are called by science in this state as electrons.***

We are summing up you to the idea that just the oxygen becomes the main supplier of the solar energy into the body.

We breathe constantly, day and night. We need breathe to heat the body. AMP and ADP - is a kind of energy currency in the body.

In areas where winters are cold, people and animals breathe more often and more deeply, to keep warm. I.e. even in cold the body receives a sufficient number of particles.

Solar energy of a certain quality fills the body, creates a background in which the child exists comfortable and familiar. And it further, its body supports this state with the help of heart rate and breathing rate and depth. During the breathing our body receives energy in the form of free solar photons. And this takes place also by the way of attraction of similar energy from the environment.

In this regard, all of signs can be divided into two groups. We can call them as the January and July groups. For the northern hemisphere they are, respectively, the winter and summer groups. To the south - on the contrary.

The entire calendar is divided almost equally into two halves.

The boundaries between groups are approximate, vague - in fact, they are almost none.

Each group consists of the months surrounding the January and July on both sides. And there are constellations corresponding to the months.

The January group includes 6 Solar Signs. Sagittarius, Capricorn, Aquarius, Scorpio, Libra and halves of Pisces and Virgo. In accordance with the Western tradition, these are the former Capricorn, Aquarius, Pisces, Sagittarius, Scorpio and halves of Libra and Aries.

The July group includes the remaining 6 Signs. Gemini, Taurus, Aries, Cancer, Leo and halves of Pisces and Virgo. In Western astrology they are Cancer, Gemini, Taurus, Leo, Virgo and halves of Libra and Aries.

When the Earth is projected onto the constellations of the January group: Gemini, Cancer, Leo, Taurus, Aries and halves of Virgo and Pisces, it gets more of the total solar radiation. The Solar Signs are - Sagittarius, Capricorn, Aquarius, Scorpio, Libra, Pisces and Virgo. Since the composition of the solar radiation is mainly material, it stimulates mainly the lower chakras. The bodies of lower Plans - physical and astral - passed at this time the reinforced flow of energy. To counter this and not unduly disintegrate, these body-shells are compacted. They reinforce their structure.

That's why there is a belief that people born in the winter are stronger. This is untrue. Their bodies are denser, they are harder to destroy. They staunchly withstand adversity. Among them there are more centenarians. The sign the densest physically and in the lower levels of the astral Plan – is Sagittarius, former Capricorn. His body is as if made of a stone - so dense. But it is a figurative expression. Simply it

is more inclined to store solid chemical elements and build of them molecules with reliable chemical bonds.

However, the energy in the dense body circulates worse. All metabolic processes are slowed down. This tells the body just a little more original passivity. Diseases often occur in the chronic form.

The projection of the Earth on the constellation of July group: Sagittarius, Capricorn, Aquarius, Scorpio, Libra and halves of Pisces and Virgo means that it receives less of total solar radiation. This means that our body obtained at this time the least total amount of solar energy. The percent of long-wave is slightly larger than of short-wave. I.e. the solar radiation is less saturated by energy. As a result, the body does not need such strong defense against it and is not amplified to confront, does not seek to be dense.

Summer people on the contrary are lighter, airy – we talk about their lower bodies-shells. Energy in their bodies flows easily, freely. The metabolism is accelerated. If they get sick then it's sharply, quickly.

We can assume that the physical bodies of the January group - it is Yin and of the July - Yang.

Signs located on the border of the groups have the most balanced metabolism.

Let us write out the approximate distance from the Earth to the Sun for all months.

January - 147.10 million km;

February - 147.44 million km;

March - 148.38 million km;

April - 149.64 million km;

May - 150.88 million km;

June - 151.77 million km;

July - 152.10 million km;

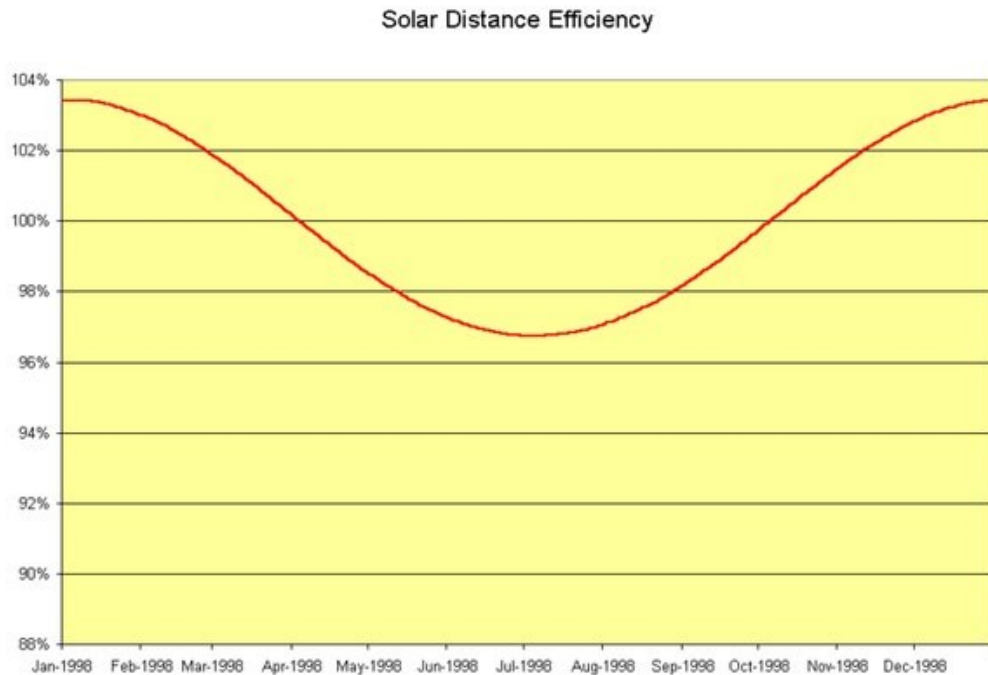

August - 151.77 million km;

September - 150.88 million km;

October - 149.64 million km;

November - 148.38 million km;

December - 147.44 million km.

If you look at the following diagram describing this distance, it becomes evident that *the curve from January to July varies more smoothly than its opposite - from July to January.* It is explained so.

From January to July our planet moving on the orbit passes the projection on the Central Celestial Body. As is well known, it is furthest from us and the Force of Attraction from its side is the smallest.

At the same time, from July to January, the Earth is projected from mid-August to mid-December on the Nucleus of Super galaxy. The distance to it is middle compare to the Nucleus of Galaxy and the CCB. Hence, the middle force of attraction.

The force of attraction of these two nuclei appears here as a factor regulating the rate of change of the distance from Earth to the Sun.

If the attraction of these bodies was not at all, the trajectory of the orbit would change most smoothly.

And since the attraction of the Central Body is the smallest, then the orbit on this sector changes most smoothly compared with the Nucleus of Super galaxy, the attraction of which is larger.

10. WHAT HAS CHANGED ON THE FIRMAMENT SINCE THE EMERGENCE OF ASTROLOGY?

Astrology requires a radical revision. And we should start with astronomical changes. Currently, on the firmament there happened many significant changes.

First, *there was a shift on the firmament of the projection of the Nucleus of our Galaxy. Instead of Capricorn, as it was long ago, in the early days of astrology, the Nucleus is now projected onto the constellation Sagittarius.*

The reason is as follows.

Our solar system revolves around the Nucleus of the Galaxy clockwise. This means that the constellation of Capricorn during this movement is ahead of Sagittarius. And Sagittarius respectively is behind. And all because the stars forming Capricorn and Sagittarius, are closer to the Nucleus than our Sun. Stars in the Galaxy circulate around the Nucleus, because its attraction draws them. And by analogy with the planets in the solar system than they are closer to the Sun, the faster they move on the orbit. Due to the fact that the smaller is the distance, the greater is the force of attraction of the attracting object, and the faster is the ethereal flow. It turns out that the stars of Capricorn and Sagittarius overtaken our Sun. And for centuries and millennia that have passed since the emergence of astrological science, constellations in the sky shifted. And now for us Sagittarius take the place of Capricorn. It is the Sagittarius is now projected onto the Galaxy Nucleus.

Why did we decide that once ago the Nucleus was projected onto Capricorn? And now for us Sagittarius take the place of Capricorn. It is the Sagittarius is now projected onto the Galaxy Nucleus.

Why did we decide that long time ago the Nucleus was projected onto Capricorn?

Let's recall some information from the previous article.

In astrology to measure the distance to one of the three giant celestial bodies, determining our solar system (and the Earth and

everything on it) it uses the classification of particles according to the elements. This system allows you to learn the qualitative composition of the radiation emitted by these celestial bodies, and reaching the Earth.

If you remember, in the book "The main occult laws and concepts" (<http://www.amazon.com/dp/B00IZGDHHY>) we talked about the fact that all particles in the Universe can be represented as the square of the elements. Earth, Water, Fire and Air. Earth - destroy a lot of ether, create a little. Water - destroy a little and create a little. Fire - destroy a lot and create a lot. Air - destroy a little and create a lot.

Particles of all six plans are divided into small diapasons (spectra). And all of the particles of any such spectrum – diapason - can also be attributed to one of these four elements. Earth, Water, Fire and Air.

Particles, from the heavenly body emitting them, move by inertia - a self-sustaining nature of the movement. They are driven by the force of inertia within them. And it turns out that particles of different elements leave the heavenly body with different force of inertia (and therefore with different speed). The particles Air have the biggest force. The particles Water follow them. Then there is the Fire, and finally the Earth is. The force of a self-sustaining movement of the latter type is the smallest. The difference in the value of the force of inertia is well seen in the refraction of photons of different colors. After all the color – is the quality. The smaller is the force of inertia, the greater is the degree of deviation. And vice versa.

Particles of the Earth during their motion stop the first. Then there is the element of Fire. Then - Water. And finally, the air particles go the longest path.

We hope you have already guessed that herein lies the whole point of the idea of the distance measurement using the classification of the four elements. ***The element indicates the distance to a celestial body - the radiation source. It tells us about the quality of those particles that are increasingly slow down, if we are at a given distance from the celestial body.*** For example, the zodiacal sign of the element ***Earth*** shows that when any celestial body (a planet, a satellite, the Sun or the Earth) is projected onto this sector of the sky, it is the closest to the giant

celestial body, the effect of which (radiation) we are considering. Only because of this proximity the particles of the Earth can reach us. In sectors of the sky of other elements they are less because of slowing down and stopping.

An astrological sign of the element ***Fire*** means that the distance has increased. And when a planet, the sun, a satellite or the Earth itself is projected onto this sector of the sky, the less number of elementary particles, emitted by this giant celestial body, reaches it. A zodiac sign belongs to the element of Fire because the particles of this particular element at a given distance are increasingly disappearing from the stream of radiation reaching our system. Particles of the Earth element there are in this area and even less.

A zodiacal sign of the ***Water*** element means that when any celestial body in our solar system has the projection on it, this body is an even greater distance from one of three giant celestial bodies, whose influence we are studying now. And particles whose quality corresponds to the elements Water, at this distance to our solar system more and more are stopped and are absorbed by the substance of the space environment.

And finally, the sector of the element Air on the zodiacal circle shows us the greatest distance to one of the “Nuclei – grandparents”, whose influence we investigate. The particles of this element - Air - reach us the most. The particles of others are in a lesser extent. Water, Fire, Earth - descending.

However, we should not think that if any sector of the zodiacal circle denotes a particular element, such as Earth, the particles only this quality will reach us from this part of the sky. No, it is not so. ***An element indicates that amount of the particles precisely this quality becomes in the radiation reaching up less and less.***

Blurred the boundaries between sectors are not sharp. One area of the sky gradually turns into another. This also applies to the quality of radiation reaching us. When we enter into a nearby sign, the quality does not change instantly.

A zodiac sign element "Fire" indicates that in this area of the sky a celestial body (planet, sun, moon) is located at a greater distance from a giant celestial body, compared with the previous sector of the element "Earth". And particles "Fire" are gradually begin to slow down - but there are very much of them still. On other remaining sectors - elements of "Water" and "Air" – it becomes less of particles “Fire”.

On a sector of sky of the element "Water" particles of this element begin to slow down and disappear.

And on a sector of the element "Air" it happens to the particles of the element “Air”.

So now Sagittarius replaced Capricorn. Projection onto Sagittarius indicates the shortest distance to the Nucleus of our Galaxy.

The second change in the sky – is the offset of all constellations in the month ahead.

So, in this case, any change in position in space has not occurred. This shift of the constellations, we can say, is man-made.

The reason – is the gradual heating of the Earth and the increasing of the distance between the planet and the Sun. The year (period of turnover of the planet around the sun) is constantly and steadily increasing. Ever since astrology arisen centuries and millennia have passed. And all this time the period of turnover is slowly increasing. And we, people still measure the same - 365 days a year (366 in leap years). So it has happened that the astronomical year is growing, and a year as a certain number of days in the year remains unchanged. Hence there is a displacement of the constellations in relation to the months.

We believe we need to take into account this permanent elongation of the year and make the necessary corrections. Otherwise, over time the constellations will shift even more in relation to the months and will not stop on this.

By the way the precession of the equinoxes is also caused by the increasing heating of the Earth. The vernal equinox - this is the moment when two hemispheres of the planet (north and south) are warmed

equally (though, as it takes place at the time of the autumn equinox). At the time of the winter solstice the northern hemisphere turns away from the sun maximally. From the time of the winter solstice to the vernal equinox the northern hemisphere begins to turn toward the sun, and the southern, on the contrary, begins to turn away from because of the heating of its entrails. Because the general warming of the Earth increasing every year the southern hemisphere warms up a little faster than the year before, and begins to turn away from the Sun earlier. From here there is the fact that the vernal equinox each year comes a little earlier. I.e. this is the precession of the equinoxes.

A resume.

Because of this double change – of displacement of the constellations relatively to the calendar, as well as due to the movement of the projection of the Nucleus of galaxy from Capricorn on Sagittarius – it has become quite difficult to study the zodiacal influences.

First, the old stereotypes act and the names of astrological signs are pronounced without regard of displacement of the constellations. For example, I was born when the Sun was projected on Sagittarius – this is in reality. But according to the old traditions my sign is still called Capricorn. If I start talking that I'm Sagittarius, then others will imagine in the head corresponding description of the sign of Sagittarius - the one used so far – super energetic, spry. I.e. that sign that corresponded to match the end of November and two ten-day periods of December.

So I continue to be cited as Capricorn, while stipulating that Capricorns now - are Sagittarians, although their characteristics are still the same, capricornian.

And this is in the case of each Sign.

Aquarius – is Capricorn now, but with Aquarian character – i.e. its description as the old Aquarian type.

Pisces – is Aquarius, but in fact Pisces.

Aries – are Pisces, but they have remained on quality Aries.

Taurus – is Aries and the character – is of the Taurus.

Twins - are Taurus, but only under the name of the constellation, on which the Sun is projected.

Cancers are Twins, but they remain the same familiar to us Cancers.

Lions must now be referred to Cancers. However, their nature - is of Lions.

Virgin – is Lions for the title.

Libra - Virgo.

Scorpions - Scales.

Sagittarius - Scorpion.

The names have changed, but the true nature remains the one that corresponds to the old system of signs.

Secondly, the projection of the nucleus of the galaxy is also changed. So, the signs changed, on which this celestial body exerts a main and additional influence. Previously, the main influence was obtained by the solar signs - Cancer, Gemini, Taurus and Aries. If we consider the position of the Earth on the orbit, it is the opposite signs - Capricorn, Sagittarius, Scorpio and Libra. Leo gets an additional influence (opposite sign - Aquarius). And now it's Solar Signs - Gemini, Taurus, Aries and Pisces. Opposite signs – are Sagittarius, Scorpio, Libra and Virgo. An additional influence gets Capricorn (opposite sign - Cancer).

Third, we always have to take into account that the position of the sun in the sky – thin is one, and the position of the Earth - is another. And we must keep in mind the need of changing the constellations to the opposite.

11. THE MAIN INFLUENCY OF THE GIANT CELESTIAL BODIES AND ADDITIONAL

We have introduced into astrology so many updates and additions that it seems from it, former, little left. But we will not stop our work of innovators and will continue to correct erroneous and outdated.

It's time to tell you about one important rectification.

It concerns the number of particles received by the sectors-constellations on both sides of the constellation of the element Earth, and that is projected on any of the Nuclei. There is the *main* influence and there is *additional*. We will tell more.

First, any of the three giant celestial bodies affects their radiation all the celestial bodies in our solar system, where they would be on their orbits. Radiation reaches all people, everywhere. After all, our system is included in all of these galaxies and Super galaxies, and especially in the Central Celestial Body as a small component.

However, a small difference in the quality of the radiation reaching us still exists, depending on the location within the boundaries of our solar system.

Second. We were told that the zodiacal circle is divided into 3 main zones, each of which corresponds to the projection on one of the "Nuclei". All it's true. But it would be absurd to claim that the radiation moves only in one side from the nucleus, in a clockwise direction. In this connection, we highlight zones corresponding to the 4 elements, and differing by the distance from the nucleus and the quality of radiation.

So therefore, we could with the same success allocate on the zodiacal circle the sector of 4 elements not only in a clockwise direction - Earth, Fire, Water and Air, but counterclockwise. So that each Nucleus spreads its radiation in both directions. And the sector of the element Earth for each of the giant celestial bodies is a single, and corresponds to the nearest distance to it. And the sectors of other 3 elements must be positioned on both sides of this sector "Earth".

They must be. But are they placed in reality? This statement is only partially true.

If a celestial body emitting particles rotates on its axis, then the predominant direction of movement of the emitted particles will be subordinated to this rotation. What does this mean? And this means that the rotation of a celestial body, to some extent, prevents their free emission in all directions. When the body rotates, it moves relative to the surrounding ethereal field. And, naturally, this ethereal field becomes an obstacle to the emitted particles. This means that ether presses on the

particles and displaces the direction of their movement. It's harder to the particles be emitted against the direction of rotation of a celestial body, rather than the reverse, to follow it without resistance.

It is for this reason the larger amount of the particles emitted by the Nuclei of the galaxy and super galaxy falls on the sectors of the zodiacal circle following a clockwise direction, rather than the ones that go against.

A greater number of particles falling on the sectors-constellations on the right side of the constellation of the element Earth - is the *main* influence. And a smaller number of particles reaching the sectors of the sky on the left - this is an *additional* influence.

We will explain.

For example, the Nucleus of Super galaxy is projected onto the constellation Taurus. This is the element of Earth. And a large number of particles reaches the sectors corresponding to the constellations Aries, Pisces and Aquarius. I.e. it's to the right side from the sign Taurus, and not to the left. And a smaller number - falls just to the left, i.e. where Gemini, Cancer and Leo are located. Actually, of these signs from the left, only Gemini receives more or less enough from the Nucleus of Super galaxy to take account of this radiation.

The same can be said about the radiation from the nucleus of the galaxy. The constellation Sagittarius - this is a sector of the Earth element. There is a minimum distance from the galactic nucleus. The sectors to the right - the constellations Scorpio, Libra and Virgo - get more particles emitted by the nucleus of the galaxy, rather than sectors of the constellations to the left - Capricorn, Aquarius, Pisces. Of them only a sector of Capricorn receives from the galaxy nucleus enough, the rest – quite a bit.

As for the Central Body of the universe, it does not rotate. In contrast to the nuclei of galaxies and super galaxy. And so there are no factors that can interfere with the movement of emitted particles uniformly in all directions. This means that the particles of the Central Celestial body in the Universe reach the sectors and to the left and to the right of the constellation Virgo in equal amount. As you remember, the

Central Celestial Body is projected on the Virgin. This is a sector indicating the shortest distance. And zodiac signs on either side of the Virgin receive an equal number of particles from the Central Body. On the right - Leo, Cancer, Gemini. On the left - Libra, Scorpio, Sagittarius. So that on the sectors of the constellations Libra, Scorpio, Sagittarius the bodies in our solar system receive a double portion of the particles – simultaneously from two giant celestial bodies - from the Nucleus of the Galaxy and of the Central Body of the universe. Perhaps it can explain the amazing physiological characteristics of such Solar Signs like Aries, Taurus and Gemini. And Pisces. They get strong development as the lower chakras and higher. A powerfully developed physical and astral body, combined with a great intellect and mental properties. Of course, this is just background, it all depends on each individual.

As you understand, when we talk about the Solar signs, we mean the position of the Earth in the opposite constellations - Libra, Scorpio and Sagittarius. It is on these constellations our planet is projected when the Sun is in Aries, Taurus or Gemini.

And do not forget about the displacement of the constellations.

Hopefully now you begin to imagine how thin there should be astrological interpretation of characters and fates. And without an accurate analysis we can't do this. But this intuitive science will allow only to close and feel information about the quality of affecting emissions. And, of course, it will not allow to generalize or rigidly standardize.

12. THE PROOF OF EXISTENCE OF CELESTIAL BODIES ANCESTORS – THE CENTRAL CELESTIAL BODY OF THE UNIVERSE (CCBU), THE NUCLEI OF SUPER GALAXY AND GALAXY

We have no plans to persuade skeptics that vehemently denies the existence of astrological influences and do not recognize astrology as a

part of human knowledge. We do not hope too on instant revolution in astronomy.

We only wish to interest in the new concepts those open-minded researchers in astronomy and astrology who are not fully satisfied with the whole set of information and facts available to these two sciences.

At present the theory, that asserts the idea of existence of the Central body of the universe and of the phased birth of all other celestial bodies of a smaller scale has not yet gained popularity and worldwide distribution. However, sooner or later it will happen. And people everywhere will know the true history of the formation and existence of our universe.

We want to give to your attention the number of facts that can help to take the new knowledge to those of you who are already internally ready for it. Who is configured to the same information wave that we are. And who would not deny that catches your eye just because it is at odds with conventional notions system. We appeal primarily to the independent from the public opinion seekers of truth. We hope for them.

Here are the promised evidences indirectly supporting our concept of the structure of the world.

First.

It is in the constellation Virgo there are the largest clusters of galaxies. In the upper right area of this constellation at least 2500 distant galaxies is concentrated. This cloud of galaxies goes beyond the boundaries of Virgo and extends into the region of the constellation Coma Berenices. It is believed that it is located at a distance of not less than 1.3 billion light years.

"The Local Supercluster of galaxies (Virgo supercluster) – is the system of galaxies with the size about 200 million light years, including the Local Group of galaxies, the cluster of galaxies in Virgo and several other clusters and groups of galaxies. In total, the Local Supercluster includes 100 groups and clusters of galaxies (with a dominant Virgo cluster in center) and about 30,000 galaxies; its mass is of 10^{15} solar masses ($2 \cdot 10^{46}$ kg).

It (the local cluster) is a flattened form, consisting of several chains of galaxies (filaments), whose projection on the sky looks like a band covering the whole sky, within which there are most bright galaxies (a kind of analogue of the Milky Way). This feature in the distribution of the night sky objects was discovered the first time by the great astronomer William Herschel in the late XVIII century. Then it was rediscovered several times, until finally, in 1953, it attracted the attention of Gerard de Vaucouleurs (USA).

The words about the fact that the local cluster, as it is called in science, "*in projection on the sky looks like a band covering the whole sky, within which there are most bright galaxies*" are and all prophetic and absolutely accurate.

This fact of existence of the Virgo supercluster of galaxies can be seen as indirect evidence that the Central Celestial Body of the universe is projected exactly on this constellation.

Others superclusters of galaxies in the sky like this do not exist. And, besides where in this part of the sky come from so many galaxies? In our view, the theory of random formation of celestial bodies from the gas-dust matter is somewhat naive. And the conception of ejection of smaller amounts of material from the larger, as a result of heating the latter, looks more convincing.

This was the first proof of our theory.

Second.

According to our hypotheses, as well as to the basics of esoteric astrology, the Nucleus of Supergalaxy is projected onto the constellation Taurus - it refers to the element Earth.

A presence in the constellation of two very large star clusters - the Pleiades and Hyades – can serve as a proof of this fact.

Two large star clusters are projected on one constellation. Again, coincidence? And, maybe, it's immediate confirmation of our proposed model of the universe?

Third.

The law of gravity was discovered by Sir Isaac Newton in the 17th century. However, scientists still do not yet fully understand its

mechanism of action. And can't always recognize its manifestation in the Nature.

This was said to draw your attention to two undisputed, in our opinion, evidences of existence of the giant celestial bodies progenitors, and the phenomenon of gravity serves just as evidenced to this.

As you know, our planet is closest to the Sun in early January, when the Sun is projected onto the constellation of Sagittarius - 147 million km. Once upon a time when astrology was only born, at this time the sun projected on the Capricorn. While the Sun is projected onto Sagittarius, Earth is closest to the opposite sector of the sky - the constellation Gemini.

At the same time, the Earth is farthest from the Sun at the beginning of July when our star is projected onto the constellation Gemini - 152 million km. And the planet itself at this time passes through that portion of the orbit that is closest to the constellation Sagittarius.

About what do these facts evidence?

They are just explained by the law of gravity.

In the first case, when the Earth is closest to the Sun there is a weakening of the attraction.

In the second case, when our planet is farthest from the Sun, there is a strengthening of gravity.

But what does pull the earth when it moves around the Sun 's orbit?

We hope you guessed it.

The shape of the orbit of the Earth, as well as of many other planets, has a peculiar form - elliptical. Moreover, the sun is not in the center of the ellipse and is biased to one of the foci. Scientists assure all that this form of orbit explained by the Kepler's laws. However, Kepler only indicated on this fact, but did not explain it.

We, on our part, offer as an explanation, the action of gravity of the giant celestial bodies, which include our planet and our solar system as small components.

Three huge celestial bodies cause our system – the Central Celestial Body, the Nucleus of Super galaxy and the Nucleus of our Galaxy. Naturally, they have the Fields of Attraction. And the force of gravity of them affects on any celestial body in our solar system. It is this force alters the shape of the orbits of the planets, forcing to deviate from the ideal circular motion.

According to the Law of gravity, the greater is the mass of the attracting body is, and the smaller is the distance, the greater is the force of attraction.

The Central Body – is the largest and most massive object in our universe. However, the distance between it and our system is very large (billions of light years). Hence - the smallest gravity force felt from its side. Namely the distance plays a major role.

The Nucleus of the Galaxy on the contrary is the smallest in size and mass. But it is the closest to us. And therefore the force of attraction is very tangible.

Gravity of the Nucleus of Supergalaxy is intermediate in size, as well as its size and the distance to it.

It turns out that the Central Celestial Body attracts (affect with gravity) planets least of all. So, its weakest attraction least of all alters the shape of the orbits. It weakly rejects them to itself. And on a sector of the element Air this is most noticeable. After all it is the element Air indicates the greatest distance. So, it becomes clear why the planet closest to the Sun in January, when it passes through the sign Gemini, relating to the element Air. The planet is closer because it deviates slightly by gravity of the Central Body. We remind you that part of the sky belongs to the Gemini constellation, experiencing the influence of the Central Body of the universe (it is projected onto the Virgin).

At the same time, the Nucleus of the Galaxy attracts heavenly bodies of our solar system to the greatest extent. And because this it most strongly alters the shape of the orbits of the planets. The Nucleus of the Galaxy is projected now on the constellation Sagittarius (once upon a time it was projected on the Capricorn). That is why, when the planets are on this section of the sky, they are in the most distant from

the Sun. The Sun itself at this time is projected on Gemini, and there is the beginning of July on the calendar. The constellation Sagittarius now refers to the element Earth (the biggest part of it), which indicates the shortest distance to the Galactic Nucleus.

We hope that presented evidences partially or completely have convinced you in the truth of our theories.

13. "ESOTERIC ASTROLOGY" OF ALICE BAILEY

Much of the information on this topic has already been transmitted through Alice Bailey in the book "Esoteric Astrology". This work contains a lot of very valuable facts and knowledge. And especially in the first place, it concerns the characteristics of astrological signs.

However, this book does not point directly to the reasons for which the zodiacal signs have certain properties. It describes the consequences, but the reasons are not touched. Allusions to them are made, but they are not fully described.

And besides that, this book Alice Bailey presented an old scheme of astrological signs. But more about that we'll talk later.

We will not explain all the details why all information was not assigned immediately. Although we will give a hint. At that time, the necessary scientific basis to uncover in all details the whole sense of astrology and its effects on Earth and humans was not prepared in the human society.

We would like also to mention the book with the same name - "Esoteric Astrology" written by Alan Leo, the disciple of Helena Blavatsky. It contains lot of interesting information, and it is certainly worth reading.

As for books on astrology related to the western school, and that in the modern world is the vast majority, among them you can find many very valuable research and very precise characteristics. We will not list here all you like. We just note that there are a lot of them. This indicates that astrology as a branch of science does not stand on place and intensively develops.

Although, to our regret, there was no any hint of what astrologers understand the essence of true astrological influences.

14. ON WHAT DOES THE SUN INDICATE?

Any astrologer primarily explores the so-called Solar Zodiac Sign. This is – the most important, from what we need to start any horoscope.

Why is the Solar Sign important?

Because it is an indication on the position in the sky (or rather, on the orbit around the Sun) of our own planet - Earth. In contrast to the situation of other planets, the Sun and the Moon, which are only performed and transformed influence (radiation). I.e. in the case of positions of the planets in the signs we define the quality adjustment of the radiation reaching the Earth. And in the case of the Solar Sign we don't make such adjustment - we are talking about the quality of the radiation reaching us directly and our planet - it is not changed (not transformed) by a planet or other celestial body, getting up in its way.

All zodiacal influence on the human body is based on the location of the planet in a particular area of the sky. All the Earth's orbit we divide into three zones. They correspond to the projection on the three main giant celestial bodies, to which our solar system is related and by which it is determined. These are the Nucleus of the Galaxy, the Supergalaxy and the Central Body of the universe.

The Sun, as mentioned also affects. But it is at the center of the system, and thus does not divide the sky into zones.

Each of these zones of the orbit is projected on one of the "Nuclei". All 12 constellations can be divided into three groups of four each. Each group "indicates" on one of the "Nuclei". On the Nucleus of our galaxy, on the Nucleus of Supergalaxy, which includes our galaxy, and finally, on the Central Celestial Body.

The constellations of all 4 elements - Earth, Fire, Water and Air – are presented in each of the three groups. We have told above about the reasons for using of this classification. Particles of different elements

have different inertial force and move at different speeds. And particles of 4 elements are slowed and stopped on the different sectors of the orbit differently.

Photons of the element Air are least absorbed and have the longest inertial motion. Then - Water. Then - Fire. And then - Earth. Because of this THE QUALITY OF THE RADIATION REACHING THE EARTH (OUR PLANET) IS CHANGED.

DEPENDING ON THE SECTOR OF THE EARTH'S ORBIT THE EARTH RECEIVES RADIATION DIFFERENT IN QUALITY.

Nevertheless, **ON ANY SECTOR OF THE ORBIT OUR PLANET ANYWAY RECEIVES PARTICLES FROM EACH OF THREE GIANT CELESTIAL BODIES AND NOT ONLY FROM THAT TO WHICH IT IS CLOSER.** However, the greater closeness to one of the Nuclei, and the smaller to other affects the quality of the energies reaching the Earth and irradiating it.

12 constellations - 12 zones of the orbit. Each zone - is a radiation of a new quality radiation. Because of this difference there are 12 types of human characters and not just people.

Each sector of the orbit - is a projection on one of the constellations and simultaneously on one of the "Nuclei".

Each sector of the orbit (one of 4 in each of three groups) belongs to one of the elements.

A sector Earth indicates that in this area very many particles of the quality Earth reaches the Earth's orbit. But on other sectors there are less of them. A sector Fire – the particles of this element begin here to slow down. Water - particles Water stop here. Air - Air particles.

In the end, it turns out that on the sector of the element "Earth" there are most particles of varying quality - and Earth, and Fire, and Water, and Air. And all because of the proximity to the greatest Nucleus that affects on the planet.

On a sector "Fire" there are the particles "Fire", "Water" and "Air". And "Earth" is a little.

On a sector "Water" there are the particles "Water" and "Air". "Fire" is a little. "Earth" is and even less.

And finally, in the sector "Air" there are the particles largely "Air". And in general, here there is less in total of the radiation of the Nucleus because of the largest distance to it. Particles of remaining elements there are a little.

 Do not be surprised. These three "Nuclei" very affect us. For example, the orbits of the planets are elliptical because of the attraction of the Galaxy Nucleus. Ellipticity is expressed differently because of unequal Fields of Attraction and Repulsion of the planets (in the language of science, due to differences in mass, although to speak so is not entirely correct, since the mass - it's the gravity field, and to indicate the repulsive field in science there is no a concept of antimass).

Within each of the three groups on the orbit there are 4 sectors corresponding to the 4 zodiac constellations, more precisely, to the projection on them. And in each of these three groups you will find a repetition of the following sequence - Earth, Fire, Water, Air - if you go in reverse order. Again, here we present a slightly outdated version of the classification.

Capricorn, Sagittarius, Scorpio, Libra - Earth, Fire, Water, Air.

Taurus, Aries, Pisces, Aquarius.

Virgo, Leo, Cancer, Gemini - the same.

The group 1 indicates on the projection of our Galaxy.

2nd - on the projection on the sky of the Supergalaxy Nucleus, which includes our galaxy .

3rd – the projection of the Central Body of our universe.

Now, however much has changed in the sky. We need to make adjustments.

Note the interesting fact.

When our planet is on a particular part of the orbit (i.e. projected on a particular constellation), at this very time **THE SUN PROJECTED ON THE OPPOSITE CONSTELLATION ON THE SKY**. I.e. for example, if the Earth (planet) is projected on the Virgo in relation to the Sun, the Sun at this time is projected on Pisces. But **WE NEED TO KEEP IN MIND AT THIS TIME JUST THE POSITION OF THE**

PLANET – i.e. *WE NEED TO AWARE THAT THE PLANET AT THIS TIME IS THE CLOSEST TO THE VIRGO, ALTHOUGH ASTROLOGY SPEAKS ABOUT THE SOLAR SIGN PISCES.*

And so there is in the case of each constellation. I.e. we need to evaluate that element, to which the constellation belongs, on which the ***PLANET IS PROJECTED, NOT THE SUN.***

The Solar Sign Aries. The Sun relative to the Earth is projected to Aries, the planet relative to the Sun is projected on the Libra. The planet at this time is closest to the Nucleus of our galaxy. But as Libra – is the Air element, then the planet is the farthest from the "Nucleus" in comparison with other 3 sectors of this group (Scorpio, Sagittarius, Capricorn). I.e. a human born under the sign Aries gets the energy of the quality Air, as the planet is projected on Libra, Air Sign. Air – is particles carrying the most energy, emitting most of ether (energy).

The Solar Sign Taurus. The Sun is projected on the Taurus and the planet relative to the Sun is projected on the Scorpio. The planet is the closest to the Nucleus of the Galaxy. Scorpio - is the element Water. So the planet a little closer to the "Nucleus" than the previous sector – Libra, Air. The human under the sign Taurus receives energy of Water, as the planet is projected onto the Scorpio, the Water Sign.

Here we should pay attention to the following fact.

We usually say about the zodiac sign, focusing on the projection of the sun.

For example, the Leo is Fire Sign for us, the Virgo - is Earth, the Libra – is Air, and the Scorpio – is Water.

In reality everything is reversed. And you need to consider the element of the constellation where our planet is projected.

Leo - is an Air sign. It corresponds to the position of the planet in Aquarius.

Virgo - Water. The planet is in Pisces.

Libra - Fire. The planet is in Aries.

And Scorpio – is Earth. The planet is in Taurus.

And we need to analyze other signs in the same way.

Fire signs - are Air, Air – are Fire, Earth - are Water and Water – are Earth.

After all, according to the classification of 4 elements the particles Air are most energy-saturated, Fire - slightly less, Water - rather energy-privative and Earth - the most energy-privative. Air and Fire - is Yang, Spirit.

Water and Earth - is Yin, Matter.

In real astrology we should reverse all signs and consider the position of the planet Earth.

However in reality, due to changes in the sky, now the many have shifted. We can confidently assert that the given scheme was 100% true in the early days of astrology. Now it so happens that not Fire sign as once but Earth one is opposed to the sign of Air. An example – is Gemini and Sagittarius. Gemini is an Air sign. A Sagittarius was Fire, but now it is Earth.

Secular Western astrology does not know and does not take into account very much. For example, the fact that Capricorn - is now "empty" sector of the sky. I.e. the constellation not related to any one element is opposed to the Water Sign of Cancer.

We need constantly remember that the position of the constellations in the sky changes. And there is a movement of our solar system as part of the galaxy - which means that it is displaced relatively to the Nuclei of Supergalaxy and the Central Body of the universe. And the very Nucleus and the whole our Galaxy rotates around the Nucleus of Supergalaxy. And Supergalaxy rotates too. Because of this we need constantly to correct the astrological projections. Because of this the Zodiacal Signs are shifted. Projections now are not the same, that of a century ago. In the books of Alice Bailey it says that once upon a time was not 12 Signs, and 10. It's right. Because of all these rotations of celestial bodies around each other and around themselves periodically there are situations when the Nuclei are projected on the same areas of the sky, and at this time, other areas remain empty. This means that from this side the radiation from the giant celestial bodies is weakened due to

their displacement. While the combined effects of radiation of the shifted Nuclei will cause at certain times of the year (when the planet is moving on the orbit) the increased energy supply of the planet due to the summing of particle fluxes.

15. THE DETAILED ADJUSTMENTS IN ASTROLOGY DUE TO CHANGES IN THE SKY

As already mentioned, in the sky there were a number of changes.

The Nucleus of the Galaxy is now projected onto the constellation Sagittarius, instead Capricorn.

And more *all constellations have moved forward with respect to the month calendar - counterclockwise.*

Unlike the school of Western astrology, the *Indian branch Jyotish* account for all these changes. And this is its distinct advantage and an indication on the living development and not the follow the deadened traditions. Although the western branch, of course, very enriched astrology by exact characteristics and deep analytical approach.

But what follows from the changes on the welkin?

First, not Capricorn, but Sagittarius now indicates that part of the sky, the projection on which of the planets of our solar system shows the smallest distance from the Nucleus. In other words Sagittarius now is the sign of the element Earth, and not Capricorn. I.e. when a planet (or the Sun or the Moon) is projected on Sagittarius, it is closest to the Nucleus of our galaxy. And the element Earth tells us that the particles exactly of this quality at this sector of the sky reach us in the greatest quantity (and on the sectors of other elements there are less of them).

At the same time the zodiac signs Taurus and Virgo are of consistent quality - they are also belong to the element Earth, as they also point to the closest distance to the Nucleus of Supergalaxy (Taurus) and the Central body of the universe (Virgo). Here nothing has changed.

But in the end, *under the influence of the Nucleus of Galaxy only three zodiacal constellations are - Sagittarius, Scorpio and Libra.* But this does not mean that there are three elements too - Earth, Fire and Water. No, there are still four of them - Earth, Fire, Water and Air. Just now the element Air comes to a neighboring sector, related to the central Body of the Universe. And now sign Virgo simultaneously refers to two elements - Earth (its own area) and Air (neighboring).

As for the constellation *Capricorn*, which previously indicated on the Nucleus of the Galaxy - *it is now "empty" - does not belong to any of the Nuclei.* "Belonging to the Nucleus" means to experience its influence, the impact of particles emitted by it. But do not forget that in some place where of the solar orbit the Earth was not, each of the three giant celestial bodies affects on it. And astrology explores only the subtle nuances of this influence.

It was the first change that should be made in the theme devoted to the detailed adjustments in the interpretation of the astrological signs.

Second.

Due to the fact that the period of revolution of the Earth around the sun rises, and the length of the calendar remains the same, all of the constellations have shifted one month forward, counterclockwise.

But the constellations - this is one and the zodiac signs – it's quite different. Constellations - it just clusters of stars. And the signs, as it follows from the very word, indicate. And they indicate to a location in the space of sources of energy, influencing on our solar system - giant celestial bodies progenitors. The central body of the universe and Nuclei of Supergalaxy and Galaxy.

The size of signs and constellations do not match. Astrological signs – are conditionally selected areas of the zodiacal circle. There are 12 of them. If 360° circle divided by 12, it will turn out that each sign has 30°. While the sizes of the constellations can be less and more of these designated thirty degrees. Zodiac signs are needed in order to be able to see exactly which sector of the sky to which element and to

which of the nucleus belongs, that it is important to assess the quality of radiation.

We know that in the early days of astrology, zodiac signs in relation to the calendar were projected by following way. According to them now, without making any adjustments, all astrologers of western school also work.

Aries – from March 21 to April 20;
 Taurus - from April 21 to May 20;
 Gemini - from May 21 to June 21;
 Cancer - from June 22 to July 22;
 Leo - from July 23 to August 23;
 Virgo - from August 24 to September 23;
 Libra - from September 24 to October 23;
 Scorpio - from 24 to 22 November;
 Sagittarius - from November 22 to December 21;
 Capricorn - from December 22 to January 20;
 Aquarius - from January 21 to February 18;
 Pisces - from February 19 to March 20.

Also it is known to us the numbers and months, on which the certain constellations are projected. It's not outdated information, and those that correspond to the actual position of the stars in the sky.

Aries - April 19 - May 13 (25 days - while the Sun is in the constellation);

Taurus - May 14 - June 19 (37 days);
 Gemini - June 20 - July 20 (31 days);
 Cancer - July 21 - August 9 (20 days);
 Leo - August 10 - September 15 (37 days);
 Virgo - September 16 - October 30 (45 days);
 Libra - October 31 - November 22 (23 days);
 Scorpio - November 23 - November 29 (7 days);
 Ophiuchus - November 30 - December 17 (18 days);
 Sagittarius - December 18 - January 19 (32 days);
 Capricorn - January 20 - February 15 (28 days);

Aquarius - February 16 - March 11 (24 days);

Pisces - March 12 - April 18 (38 days).

However, as has been said, the signs – this is one, and the constellations - are quite another.

Indian (Vedic) astrology Jyotish, unlike Western, takes into account the displacement of the constellations in relation to the calendar.

According to Indian astrology the zodiac signs now are positioned with respect to the calendar as follows.

Aries - April 14 - May 14;

Taurus - May 15 - June 14;

Gemini - June 15 - August 16;

Cancer - July 17 - August 16;

Leo - August 17 - September 16;

Virgo - 17 September - 17 October;

Libra - October 18 - November 16;

Scorpio - November 17 - December 15;

Sagittarius - December 16 - January 14;

Capricorn - January 15 - February 14;

Aquarius - February 15 - March 14;

Pisces - March 15 - April 14.

What do we use, on what do we navigate – on the signs or on the constellations?

The answer is – and on the ones and on the others.

In fact, it's important for us the exact location and size on the sky only of three constellations - those that indicates to the celestial bodies first parents. These are Sagittarius (the Galactic Nucleus), Taurus (the Nucleus of Supergalaxy) and Virgo (the Central Body of the Universe). These constellations are of Earth element. They correspond to the shortest distance to these giant bodies.

The exact sizes of the rest constellations are important a little. The sizes of all constellations are different from each other. Therefore, in astrology they are replaced by the equal in size Signs.

Thus, *we need to determine as accurately as possible the projection of Nuclei – the Nucleus of Galaxy in Sagittarius. The Nucleus of Supergalaxy in Taurus – by the location of Pleiades and Hyades. And the location of the Central Body of the universe - for the Local clusters of galaxies in Virgo. Unfortunately, the last two Nuclei we can project only approximately.*

From these Nuclei we will conduct our countdown. *And after this determination, not constellations but signs need for us. In order to know to which elements which sector (sign) applies, and the radiation of what quality reaches us.*

So.

Aries has pushed back Taurus.

Taurus has climbed into the place of Gemini.

Gemini, in turn, took the place of Cancer.

Cancer is in the place of Lion.

Lion stood up into the place Virgo.

Virgos are born from mid-September to mid-October.

Libra is now instead of Scorpio.

Scorpions ranged from mid-November to mid-December.

Then Sagittarians are born. A long time ago, in December and January, Capricorns appeared on the light.

Capricorns are born now from mid-January to mid-February, replacing Aquarians here.

Aquarians pushed back Pisces.

Pisces, in turn, shifted Aries. Now they are born from mid-March to mid-April.

Here we have listed all 12 astrological signs.

Naturally we should mention the following point. When we wrote about shifting of the Solar Signs, it is not everything. The planets now are also projected onto the appropriate signs, having displaced with them in a month forward.

All the signs have shifted. *But have together with the names and all the familiar characteristics of the signs shifted?* And whether is Aries the Aries now and is Sagittarius the Sagittarius, despite the displacement? And whether that who are born under the old standards, in the time of the Solar Sign Virgo, and is now a Lion, does all the qualities and properties of the Lion get? And so on. I.e. *we are primarily interested in what is now characterize the properties of the zodiac signs due to their displacement.*

So how do we interpret the signs of the zodiac now with all these changes. Who is who to date?

We have become accustomed to the existing astrological standards. But is it actually so as astrologers of the western school assert?

People of course first of all want to know to what sign do they belong now. And what are the characteristics of this new sign.

First of all, we should remember that when we define the Solar Sign of the human, we need to turn the constellation opposite. The only way to know to which sector of the sky our planet was projected at the moment of birth – at what area of the solar orbit it was. With this, opposite to the Solar, Sign and we will work, i.e. we will determine to which Nucleus does it belong and to which element.

Let's consistently analyze all 12 Solar signs, and define the radiation of what giant celestial bodies affect them the most, and what is the quality of this radiation.

16. TWO FACTORS ON WHICH WE SHOULD ASSESS THE INFLUENCE OF THE GIANT CELESTIAL BODIES

Astrological influence - is one of the greatest mysteries. Only now we are ready in its entirety to reveal it before you. Why do zodiac signs affect differently? What is the reason that the sectors of different elements influence differently from each other?

Earlier we talked about the nature of astrological influence. And told that it is the effect on us of particles emitted by the giant celestial bodies. So we talked about that in different sectors of the sky the quality of particles reaching us is different. Now it is time to discuss the final details of this influence.

 We should consider two factors when evaluating radiation characterizing the sector of one or another area of the sky:

- 1) The total number of particles, regardless of their quality;
- 2) Qualitative composition of the radiation. How many there are particles of each specific plan, of each sub-plan (diapason) within the plan. The predominant quality, how many particles of Yin and Yang. How many of blue, yellow, red.

 The whole point of influence, coming from one of the three Nuclei, and reaching us, is in the simultaneous considering of these two factors. This is the only way to grasp the full meaning of exposure to radiation coming from outside to our planet.

The Central Celestial Body (CCB), the Nucleus of Galaxy and the Nucleus of Supergalaxy Galaxy - they emit a different amount of particles (regardless of their quality) and different in the qualitative composition.

 The Central Celestial Body is the biggest of them all. The larger is a celestial body, the greater number of particles it emits.

In addition, according to Wien's law, the higher is the temperature of the body, the more particles of shortwave diapason it emits. Thus, there are even more particles of long-wavelength diapason in the composition of its rays. A temperature of the Central Body is greater than of all others because there are most of all matter in it (this follows from the Law of Transformation).

It turns out that the Central Body – is the most powerful source of radiation in the universe. And besides that, the particles emitted by it are of diverse quality. From the upper diapasons of the Physical Plan - radio,

infrared, microwave, visible - to lower - ultraviolet, X-ray, gamma. And besides, it emits the particles of the Plans above the Physical - Astral, Mental, Buddhic and other two (Atmic and Monadic).

However, due to the fact that the Central Body most remote from our system, in comparison with other two Nuclei, more subtle radiation reaches us – there are more particles of upper Plans than of lower ones. Because the higher is the plan, the slower its particles are slowed down.

So, the *influence of the Central Body is more subtle, more energizing, more spiritual than of other Nuclei.*

 The size and amount of the *Supergalaxy Nucleus* is smaller. Totally it emits much more modest than the Central Body. And the temperature of it is lower, so the qualitative diversity of particles is not so rich – the number of shortwave particles is much smaller than the number of long-wave.

However, it is closer to us than the Central Body. Therefore, due to the close distance, the less number of particles of lower Plans are absorbed and slowed down by the space environment.

The result is that the percentage ratio of particles of lower and upper Plans in a lesser extent is displaced toward the latter, than of the Central Body.

The *Galaxy Nucleus* repeats everything said about the Supergalaxy Nucleus, and even more.

It is even smaller in scale. Its temperature is even lower. And it is even closer to us.

As a result, the total amount of energy emitted by it is even less. Because of the lower temperatures, the percentage of the particles of the lower Plans is less in it. But because of the short distance, we receive such particles even more, in the percentage ratio, than from the side of the Supergalaxy Nucleus.

Let's make a conclusion.

Influence of the Central body of the universe is the most spiritualizing, as it contains the highest percentage of particles of the higher plans. And it is the most powerful, as it contains the most

number of particles totally. The Central Body in the greatest extent stimulates the development of the higher chakras corresponding to the Buddhic plan and the higher levels of the Mental.

The same characteristics for the *Nucleus of Supergalaxy* are expressed in the least. *Its influence can be described as more materialistic* - the percentage of particles of lower plans is larger, and the total number of particles is less. It develops the chakras almost of whole mental plan.

And finally, *the radiation reaching us from the Nucleus of Galaxy is the most densely-material in nature* - the percentage of particles of lower Plans is the largest and the total number of particles is the smallest. It stimulates the chakras of the astral plan.

17. THE FEATURES OF RADIATION IN THE SECTORS OF THE SKY OF EACH OF THE 4 ELEMENTS

Now, when we have evaluated the basic characteristics of the radiation from all three nuclei, affecting on us and our solar system, we must proceed to assess the features of radiation in the sectors of the sky of each of the four elements, within the limits of influence of each of the three giant celestial bodies.

Before a detailed analysis, we should mention that regardless of the Nucleus whose influence we explore, *on the scale of zodiacal elements "Earth - Fire - Water - Air", the total energizing effect of incoming radiation weakens - the total number of particles becomes less. The percentage of thin, spiritual radiation increases. And the percentage of materialistic decreases.* The ratio of particles increases toward the upper Plans. From the standpoint of science, we can say - the percentage of the long-wave energies increases. And the number of particles of lower Plans falls. The number of shortwave becomes less.

Moreover, once it is worth mentioning that there is a basic and additional influence of the giant celestial bodies. We already wrote about this in detail above, but now just recall. The main influence - this

is the largest number of particles falls on zodiac signs to the right from the sector of the element Earth, and less to the left of this constellation. It is inherent to the influence of the Nuclei of Galaxy and Supergalaxy, due to their rotation around their own axis. It is not peculiar to the Central Body, because it does not rotate. The Central Body sends the same number of particles on both sides of the sector-constellation at which it is projected.

1) ***The Central Celestial Body of the Universe.***

It's projected onto the constellation Virgo. This sector of the sky refers to the element Earth. It indicates on the shortest distance to the Central Body (for planets and other celestial bodies in our system).

The same sectors of the sky on both sides of the Virgin are under its influence. On the right – there are Leo (Fire), Cancer (Water) and Gemini (Air). On the left – there are Libra (Fire), Scorpio (Water) and Sagittarius (Air). Please do not confuse with the Solar Signs, there we must turn over all. The same influence means an equal number of particles reaching us.

On the sector of the Earth - Virgo, the total number of particles coming from Nuclei is the largest not only in comparison with the sectors (constellations) of the remaining elements of the same group, but compared to all characters of all zodiac. The spectrum of particles of varying quality is the richest in comparison with the rest 11 Signs.

The Solar Sign for Virgo – Pisces - is projected to the Sun, the planet Earth is projected onto the Virgin. Under the Solar Sign of Pisces there are born from March 15 to April 14.

Use Indian astrology to determine the solar sign on the calendar, as it responds their displacement.

On the sectors of Fire - Leo and Libra - the total number of particles is less, and their spectrum is poorer than on the sector Earth.

The Solar Signs - for Leo – is Aquarius (February 15 - March 14), for Libra - Aries (April 15 - May 14).

On the sectors of Water - Cancer and Scorpio - the total number of particles coming from the Central Body is even less, and the diapason of their quality is even narrower.

The Solar Signs - for Cancer - Capricorn (January 15 - February 14), for Scorpio - Taurus (May 15 - June 14).

On the sectors of Air - Gemini and Sagittarius – there are the smallest number of particles and among them there is the most percentage of Yang and there is least of Yin least. The long-wave diapasons are prevailing.

The Solar Signs - for Gemini - Sagittarius (December 16 - January 14), for Sagittarius - Gemini (June 15 - July 16).

2) *The Nucleus of Supergalaxy.*

It is projected onto the constellation Taurus. This sector refers to the element of Earth. The minimum distance from the Nucleus of Supergalaxy.

In addition to the Taurus the sectors portions of the sky to the right of Taurus - Aries (Fire), Pisces (Water) and Aquarius (Air) experience the greatest influence from the Nucleus of Supergalaxy. I.e. more particles extend to this side than to the side of the signs on the left. The Solar Signs for them: for Taurus - Scorpio (November 17 - December 15), for Aries - Libra (October 18 - November 16), for Pisces - Virgo (September 17 - October 17), for Aquarius - Leo (August 17 - 16 September).

The Signs on the left - Gemini (the silent Fire), Cancer (the quiet Water) and Leo (the quiet Air) experience the weakened influence. But consider that the influence on them from the Nucleus of Supergalaxy is rather weak, incomparable with an influence on the signs on the right. The Solar Signs for them: for Gemini - Sagittarius (December 16 - January 14), for Cancer - Capricorn (January 15 - February 14) and for Leo - Aquarius (February 15 - March 14).

3) *The Nucleus of the Galaxy.*

It is projected onto the constellation Sagittarius, now it is a sign of the Earth element. And once upon a time the Nucleus of Galaxy

"looked" at Capricorn, and it was a Sign of the element Earth. It is in Sagittarius the distance to the Nucleus is the smallest.

The sectors on the sky to the right of Sagittarius receive the greatest number of particles from this Nucleus - Scorpio (Fire), Libra (Water) and Virgo (Air). The Solar Signs: for Scorpio - Taurus (May 15 - June 14), for Libra - Aries (April 15 - May 14) and Virgin - Fish (March 15 - April 14).

The signs to the left - Capricorn (the quiet Fire), Aquarius (the silent Water) and Pisces (the quiet Air) experience additional exposure. Additional exposure – this means a half of the particles. The Solar Signs: for Capricorn - Cancer (July 17 - August 16), for Aquarius - Leo (February 15 - March 14) and for Pisces - Virgo (March 15 - April 14).

As we said, because of the displacement of the projection of the Nucleus on the constellation Sagittarius from the constellation Capricorn, *Capricorn has become an "empty" sign*. What does this mean? This means that it is no longer under the direct influence of any one of the Nuclei. Of course, it is influenced by all of them. However, it is too far to the Nucleus of Supergalaxy – it is not even the element of Air, and even further. And from the Galaxy nucleus it receives only weakened, additional influence. This influence can be compared with that what is typical for the sectors of the Water element (the Solar Sign at this time corresponds to the element of Earth). *This means that the Solar Sign Cancer (July 17 - August 16) has now become much less energy-saturated than before*. We can assume that this is one of those that get the least amount of particles.

18. THE SYSTEM OF INITIATIONS OF THE 4 ELEMENTS

Now let's collate all information about the effect obtained by the different sectors of the sky (constellations) from the different Nuclei. We will call here as *Nuclei* for the convenience the giant celestial bodies, influencing by their radiation on our solar system.

First, we will remind you that, first of all, we estimate the impact on our planet – i.e. talking about the Solar Sign. When the Sun is projected onto one or another sign, the Earth is in the opposite projection on the sky.

Secondly, wherever within our solar system the Earth neither was (or another heavenly body - a planet, satellite), it receives a particle from all 3 giant celestial bodies.

However the location within the system nevertheless has certain differences. About them science astrology and tells, and it explores the nuances of these influences.

Let's analyze the sectors of the sky (constellations), bearing in mind that almost all of them at once, are influenced by two giant celestial bodies.

Before we will begin to talk about each constellation itself, we distinguish two common points.

First, in astrology, as well as in the spiritual practices of the East, it's taken as a basis ***the system of Initiations of the 4 elements***. Perhaps you have not heard about it. But believe us, it exists. Moreover, it is the basis of the entire evolutionary process of the universe. So overall development happens - slowly, gradually, from smallest to largest. First, we learn to hold a small amount of energy, then more and more and so on. We are moving up the evolutionary ladder. And 4 elements very well reflect the essence of what is happening. It's the transition from Earth to Water and then, to Fire, and finally to Air. The energy of these elements increases in this order. The lowest energy level there is at the element Earth, and more - at Water, even more - at Fire, and the largest - at Air. Any spectrum (diapason) can be represented as the square of the elements - from blue to red the energy of particles increases.

In esoteric literature we most often find the classification of Initiations, according to which the Fire is above the Water.

This is to some extent understandable and justified. First, the Water in the occult is lower by "rank" than Fire. Water - it is a symbol of Matter and Fire - of Spirit.

And, secondly, the particles Fire are really more energy-saturated than Water. They always Yang - emit energy. However, it is the inertial force is interested for us – in the speed of inertial motion. And in this case, the particles of Water are ahead of Fire, they move faster and longer.

 All particles of the universe totally form ***the Square of Elements***. Earth and Fire form two corners in the lower Plans. Water and Air form two corners in the upper. It all depends on the amount of destroyed Ether. Earth and Fire, as you recall, destroy a lot per the unit of time, and Water and Air - a little. But Earth and Water create a little, and Fire and Air create a lot. Hence there are such interesting characteristics of the particles.

I.e. ***the lower Plans - are Earth and Water, and the upper – are Fire and Air***. As you may recall, we explained why in astrology Water and Fire in a series of signs are reversed.

Energy centers of the human body too, as you remember are formed by the particles of different Plans - physical, astral, mental and buddhic.

The lower chakras – are Earth and Water. The upper - are Fire and Air.

The development and formation of any living creature also occurs through a serial connection and attachment of particles initially of lower Plans, and then - of higher.

If you place the signs of the zodiac within each group from those that contain the smallest percentage of particles of the higher plans, to those that contain the least, then constellations just and will be located in this way - from the Earth to the Fire, through Water and Air.

Virgo, Leo, Cancer, Gemini. Earth, Fire, Water, Air.

Virgo, Libra, Scorpio, Sagittarius. Earth, Fire, Water, Air.

Taurus, Aries, Pisces, Aquarius. Earth, Fire, Water, Air.

Sagittarius, Scorpio, Libra, Virgo. Earth, Fire, Water, Air.

19. AN OVERVIEW OF ALL CONSTELLATIONS OF THE ZODIAC. DEPENDENCE OF TEMPERAMENT FROM THE LEVEL OF DISCLOSURE OF CHAKRAS

Usually astrologers ascribe specific temperament to the signs of one element. For example, people born under the sign of Fire – are choleric, of Air - are sanguine, of Water - are phlegmatic and of Earth – are melancholic.

Let us try to explore this statement to try to understand how it corresponds to reality.

We can assume that the notion of "temperament" in modern psychology, as in astrology (closely related to psychology), is not fully disclosed. And it is presented in its most elementary form.

Temperament, if interpreted literally, is the temperature of the human body. And it is not only its physical component, but also includes all of its subtle shells. We can approximately say that it is "the temperature of the human soul". Although, in fact not only of the Soul (I), but of all other invisible bodies - ethereal, astral, mental. A temperature - is the same as the quality.

Temperament – is a cumulative quality of the human individual.

Usually people evaluate temperament on the external component, most accessible to the perception. By how a person is physically active, emotionally and mentally busy. Also, a trained eye easily track highly spiritual motives of behavior aimed at the benefit of the larger whole. This there are reflected impulses from the soul plan. But it should be recognized that an activity of the subtle bodies necessary lies behind the same physical mobility. When a person is guided by any desire, thought or idea, all this is bound to be to find a way in certain gestures, actions, speech. Physical body - it's just a transmitter and carrier of invisible energy messages.

The body can be quite weak physically. However, if a strong, willed spirit lives in it, it is capable on a stunningly intense activity.

However it's possible and otherwise. A strong and powerful body without the necessary guidance from above will live inert and sluggish life.

So as you can see, temperament is determined by a whole range of its constituent factors. And particles of ethereal levels of the physical plan constantly supplied into the body with oxygen during respiration, it is not the most important thing.

The whole totality of the energy shells of the human forms his aura. Temperament of the person is the quality of its aura, its temperature. The human can't be a piece of hot metal. His body has a quite different density, other attractive field, it will never accumulate so many free particles to overheat to red and stay alive. However the aura of the temperamental person can be felt near as warm gas.

 Once in astrology there is the idea that each element has certain temperament, then it's probably not unreasonably. What is the truth of this information?

First of all, we must remember that there are three groups of constellations, in accordance with the number of influencing nuclei.

From the part of the Central body of the universe most of the particles of the higher plans come to us and less of the lower. The total number of the particles is the largest.

In the stream of radiation coming from the Nucleus of Supergalaxy it's observed a lower percentage of particles of the higher plans and a higher – of lower.

And finally, as part of the galaxy nucleus rays reaching our solar system, there is the smallest percentage of the upper Plans and the greatest – of the lower. The total number of the particles is the smallest.

Lower Plans contribute to the development of the lower chakras in the human body, the higher Plans stimulate the higher.

From all this it can be concluded that ***the Central Body*** to the greatest extent contributes to the opening of the upper chakras submitted by the buddhic plan and the upper levels of the mental. It corresponds to highly developed people.

Its radiation corresponds to *the upper Cross, Cardinal*, which leads a human to experience of "*mountain peaks*".

The group of constellations that are affected by this influence includes Virgo, Leo, Cancer and Gemini. And besides there are Libra, Scorpio and Sagittarius – because the Central Body radiates equally in all directions.

The rays of the *Nucleus of Supergalaxy* can be considered more materialistic. They contain a higher percentage of short-wave particles.

So, they approximately equally contribute to the development of the middle chakras of the body, presented by the Mental Plan. It corresponds to the highly animals and middle developed people.

This is *the middle Cross, Fixed*, which leads a person to experience of "*plains*".

This Cross includes the constellations: Taurus, Aries, Pisces and Aquarius.

Radiation from the Galactic nucleus brings into our system the most material type of energies. The percentage of particles of lower Plans is highest compared to other Nuclei. And of the particles of upper Plans – is the smallest.

It in the greatest extent leads to the development of the lower chakras, forming the subtle bodies. It corresponds to the astral plan.

This is the *lower Cross, Mutable*, it promotes the assimilation of experience of "*caves*".

This group includes the constellations: Sagittarius, Scorpio, Libra and Virgo.

In each of the three groups of constellations there are 4 elements - Earth, Fire, Water and Air.

In this sequence of elements, from Earth to Air, regardless of the group the total number of particles reaching us and our planet reduces. Regardless of the quality of the particles. The projection of the constellation of the element Earth means the largest number of particles, Fire – less, Water - even less and Air - the least.

This is the first.

And the second - from Earth to Air the spectrum of represented particles reduces. The percentage of shortwave (low Plans) becomes lesser, and long-wave (upper Plans) are dominated more and more dominated.

The element ***Earth*** - has the richest palette. There are a lot of the upper and of the lower Plans. And the total amount of those and other is most.

Fire – the diversity decreases. And the total number does too.

Water - quality is increasingly shifting to the upper. The total number of reduces.

Air – the spectrum is even poorer, there are most of all subtle, higher. The total number is even less.

We can say that the projection on the constellation of Earth element best meet the global goal of God - to unite the Spirit and the Matter. The plans of the Creator do not include infringement of the Matter for the sake of the Spirit. No, at every point of the universe they should be merged in unity, equality and harmony.

Projection on the constellation of the element Earth in the greatest extent stimulates the development both of the upper chakras and of lower. And those and others pass through themselves the most powerful flow of energy, regardless of their quality (we are not talking here about the informational component).

Projection on the sign of the element Fire reduces opening and of the upper and of the lower energy centers (compare with Earth). But the lower are oppressed stronger. I.e. there is some imbalance in the side of upper.

Projection on Water – the opening of chakras is even weaker. It is still largely shifted toward the upper centers. Losing in the amount of the resultant particles, they win in their quality - energy of reaching particles is very high.

And finally, ***Air*** – the chakras are developed even much weaker than of all other elements. However, they are generally stimulated by the most high-energy types of particles. There are a little of them, but they are incredibly spiritually saturated.

We can say that from the Earth to Air, through Fire and Water the narrow-focus of signs increases towards the spiritual component.

This was said for the position of the planet Earth in orbit.

And for the Solar Signs, respectively - this spiritual focus grows from Water to Fire, through Air and Earth. Using the old classification we should say – from Fire to Water, through Air and Earth.

 However, we should make one addition.

Air sign - the last in the sequence and a neighbor to sign Earth neighboring the group related to the influence of other Nucleus. This means that it receives particles from it. In the case of two constellations (not Solar Signs) - Gemini and Aquarius - this effect additional, i.e. significantly weakened. But it is main for Libra, i.e. in full force.

At least, once upon a time it was. But now the Nucleus of the Galaxy is shifted to Sagittarius. And this rule is valid only for Gemini and Libra. On Aquarius it no longer applies. Now additional particles from the galaxy nucleus the sector of the sky corresponding to the constellation of Capricorn receives.

Do not forget, we are not talking about the Solar Signs, but simply about the constellations.

But anyway, Gemini and Libra still get the extra particles from the neighboring Nuclei. As a result, people born when the planet is projected onto these signs (and the sun on the opposite), centers receive greater stimulation than if they were "saturated" only by the Nucleus of their own group. It turns out that the sign of Air receives even more total number of particles than the neighboring with it the sign of its group. At least the upper chakras are reinforced repeatedly. Especially if we are talking about Libra. Solar Signs for them - Sagittarius, Aries and Leo. And now they are born about the time, when Capricorn, Taurus and Virgo previously appeared on the light.

Virgo, Libra, Scorpio and Sagittarius - is in general a special group. It is supplied in full directly from the two nuclei - Galaxy and the Central Body. The Solar Signs of this group - Pisces, Aries, Taurus and Gemini. Plus, remember that the constellations have shifted in a month.

And Pisces – are those whom we are accustomed to consider as Aries, Aries – are a former Taurus, Taurus – are Gemini and real Gemini – are yesterday Cancer. Do you begin to capture changes that have occurred in the astrological picture?

Now you yourself can make your own idea about the temperament, in other words, about the quality of all zodiac signs. We have given here only the most basic knowledge about this profound concept, dedicated to new astrology. You are free to embark on the way of researcher and based on received information, may begin to explore the human characters. As a result, astrology becomes full-fledged science, along with other existing, and will be studied in colleges and universities.

Let us try to sum up to that been said.

It's impossible to judge about temperament uniquely. This is a complex concept. Only the evaluation of the activity of all chakras forming the human body, starting with the simplest (chemical elements), and ending with the highest located in the upper parts of the brain, can give an idea of this complicated characterization.

But surely we can say the following.

Than more the total number of particles, that influence on the body at birth, the more developed will be the chakras to which these particles affected. And the larger is the diapason of involved energy centers - when and the upper, and lower - the brighter the temperament will be. And the more of particles Yang in the composition of radiation (emitting energy), the stronger and more powerful will be the physiological characteristics. After all temperament is the temperature. Brightness – is a high temperature, an emission of energy.

So what of all the signs has the brightest temperament? Who is the most energetic? Who is calm and unruffled? And who is balanced and harmonious?

Can new astrology help us find the answers to these questions?

We think so. Only it can help.

In modern classic western astrology it is assumed that the most temperamental, most energetic – are the Signs of Fire. Air Signs follow by them. That is why they simply understand each other and find a common language. Fire Signs include Aries, Leo and Sagittarius. Air Signs - are Gemini, Libra and Aquarius. And besides astrologers do not make any amendments on the displacement of the constellations relative to the calendar.

The main characteristics of the *Fire* signs are their explosive nature, quick actions, speech, a lot of ideas, bright appearance, fearlessness. Aries – is a pioneer in all. Strong, both physically and spiritually. Sagittarius - it is rather a spiritual leader with habits of dictator and lover of life. Leo – material and sensual component is on the first place. It's luxury, it's in the main focus, it's groomed and cherished.

The *Airs* Signs are credited with ease, mobility, talkativeness, sociability and remarkable intellectual abilities, combined with optionality, restlessness and lack of concentration.

Aquarians – are eccentric, friendly, brilliant inventors. Gemini – are experts in everything, rowdy, humorist and intermediaries for everything and everyone. Libra – are elegance, brilliance, charm, beauty and talent abyss.

There are some words about the *Water* Signs. There are legends about great power and huge sexuality of Scorpio. In general, the signs of Water are considered as innate mediums, psychics, artistry, supersensitive natures, great healers and psychologists. Cancers excellent make money, as well feel the financial sector. Pisces entirely are artistic people.

The *Earth* signs re silent and closed intellectuals. All is thought out, lay out on shelves, analyzed and is in perfect order. Taurus of this trio is most emotional and heartfelt. Virgo is harmonious perfectionists in everything, but they lack the fire. Capricorns – are cold hard-headed mystics and seers. All three types place the reflections to the first place in their life, but do not like to share acquired knowledge.

How are all of these characteristics corresponded to reality?

20. ZODIAC SIGNS HAVE SHIFTED. AND WHAT HAS HAPPENED TO THEIR CHARACTERISTICS?

Millions people live, from childhood to death, convinced that they are Capricorns, Sagittarius, Aries, Virgos, Cancers, Libras, etc.

Most agree with the proposed features, many doubt, the skeptics do not believe. The half-truth in astrology now so intertwined with the truth that it may be easier or to completely accept or to completely tear away these ideas.

But in this way we will not solve the problems of this area of knowledge. We need patience and courage to carefully analyze all and separate the wheat from the chaff. Then it's ceased to consider astrology as pseudoscience and it will bring humanity a lot of valuable information.

As has already been mentioned several times in this book, astrology has arisen not today. It exists more than one thousand years. And all this time it did not stand still, and was developing and improving. And the astrological characteristics of human psycho-types arose not from scratch. Detailed observations and deep, meditative analysis preceded to their identification and description.

It should be recognized that even though the fact that modern western astrology school did not make adjustments related with the displacement of the constellations, their descriptions of horoscopes, for those who born in certain numbers, or in those of other months are reasonably accurate. Astrologers continue to work and to watch. They fix reality, though not always.

Therefore people studying astrology do not need to radically break all received ideas about the signs. Essentially, they have remained almost unchanged. Just the names have changed.

Study, analyze, correlate.

21. THE CONSTELLATIONS OF THE ELEMENT EARTH – THE SOLAR SIGNS OF WATER (IN WESTERN ASTROLOGY – FIRE)

Definitely *it can be argued that the former Signs of Fire – are the current constellations of Water.* I.e. on the place in the calendar, where once Fire was, now there is Water. The Solar Water Sign - is when the sun is projected onto the constellation of Water, and our planet at this time passes through the constellation of Earth element. Please note this corresponds to reality very much. The element Earth always points to one of three giant celestial bodies influencing us. At this time, we reach the greatest number of particles emitted by the given Nucleus - as of the upper Plans and of the lower. And the total number of particles is maximal here. I.e. and the upper chakras receive the greatest development and the lower, and besides stronger than at the other elements.

This indicates a tendency to most harmonious development of the body. No skew or the side of the Spirit, nor the Matter. The powerful body, feelings, mind and soul.

We are accustomed to name by Fire those who actually born under the Solar Signs of Water (do not forget about the turning of constellations).

Former Aries - are *actually Pisces* (mid-March - mid-April). The planet at this time is in Virgo. It's the closest to the Central Body.

They are the strongest, the most rebellious, the most anger, the most energetic. The soul of this human is invincible and the body too.

Former Sagittarius – is *present Scorpion* (mid November – mid-December). The planet is projected on Taurus. It indicates on the Nucleus of Supergalaxy.

They are more balanced and calmer compared with Aries-Pisces. But only in comparison with them. They have very powerful and strong body.

Lions - are Cancers. The planet is projected onto Capricorn, "empty" sign, experiencing only an additional influence from the Nucleus of the Galaxy known as mentioned, by most materialistic character of its radiation. Perhaps that's why the Lions-Cancers (mid July - mid August) – are the people with the greatest bias towards the development of lower centers above the higher. The body for them - it's the most important thing. They are the biggest lovers of sensual pleasures. At the same time their body is able to withstand very high loads without too much damage to humans.

22. THE CONSTELLATIONS OF THE ELEMENT FIRE – THE SOLAR SIGNS OF AIR (IN WESTERN ASTROLOGY - WATER)

Fire is the next in the sequence of the zodiac elements - after Earth. The Solar Sign of Fire, due to turning, it's Air. The Sun is projected on the constellation of Fire, the planet - on Air. In each group this element indicates compared to Earth a more distant location relative to the corresponding Nucleus.

The total number of particles is less. The ratio of particles of higher and lower Plans is shifted towards the latter. The upper chakras receive more development than the lower, compared to the previous element of Earth. And general stimulation of all centers is weaker.

Everyone thinks that Water signs are such mystical, mysterious, all-round developed and vigorous. But, in fact, it is an Air Sign. And their characteristics can be easily explained by their location in the row of elements, by the quality and quantity of the resulting radiation affecting on the ratio of chakras development.

Undoubtedly the current Solar Air Signs (before they were Water) – are second on temperament (vigor) of all, after Water (considered as Fire in western astrology).

The former Pisces (mid February - mid-March) are the current Aquarians. The planet is projected onto Leo, the Sun is in Aquarius. It's an influence of the Central Body.

Those who were believed as Scorpions (mid-October - mid-November), now are Libra. The planet is in the constellation Aries, and the Sun is in Libra. This group belongs to the Nucleus of Supergalaxy.

And yesterday's Cancers (mid June - mid July) now are Gemini. Our Earth is projected onto Sagittarius and the Sun - onto Gemini. They have simultaneous influence from the Central Body and the Galactic Nucleus.

We hope it's not too difficult for you to keep track of all these twists combinations of projections of the planet and our star?

All the time remember that here we are discussing at the same time as constellations and the Solar Signs. And they are always directly opposite each other.

23. THE CONSTELLATIONS OF THE ELEMENT WATER – THE SOLAR SIGNS OF EARTH (IN WESTERN ASTROLOGY - AIR)

The third element in each group of the zodiacal constellations is Water. If you are talking about the Solar Sign, this is Earth. The planet is projected on the constellation of Water, and the sun - on the element of Earth. In the current classical western astrology the element of these Solar Signs is called Air. They include Gemini, Libra and Aquarius. Jyotish, Indian astrology, argues that it is now Taurus, Virgo and Capricorn.

In each of three groups of constellations this element indicates the more distant position relative to the corresponding Nucleus.

The ratio of radiations from the Solar Signs of the element Earth is significantly shifted to higher plans. Upper chakras are more developed, but in general in a lesser extent than at Signs of the preceding elements. Body needs are easily met, because they are small, or pacified. All efforts are directed at improving the mind and soul.

Astrologers (and anyone familiar with astrology and such people are now the majority) well know that sociable intellectuals are dominated among the "Air Signs" (now they are signs of Earth). Their

body and senses are light, agile and obedient. They are slender, beautiful, nice people.

24. THE CONSTELLATIONS OF THE ELEMENT AIR – THE SOLAR SIGNS OF FIRE (IN WESTERN ASTROLOGY - EARTH)

Air is the fourth element in each group. If we are talking about the Solar Sign, this is Fire. The planet is projected on the constellation Air and the sun on the element Fire. In the current classical western astrology the element of these Solar Signs is called Earth. They include Taurus, Virgo and Capricorn. Jyotish tells us that now they are Aries, Leos and Sagittarians.

This is very peculiar element of the zodiac signs. They are pronounced intellectuals, that is, "to the bone". But in contrast to the previous group, Water-Earth Elements (formerly Air), who are sociable, these people are intellectuals are closed. They do not like crowds, avoid contact with large groups of people. They are single-persons, loving reading, thin informal conversations, appreciating of art and peace. Most often they are punctual organizers, analysts are behind the scenes.

In each of these three groups of constellations this element indicates the most distant position relative to the corresponding Nucleus.

If we compare with the rest elements in the zodiac sequence, Air is located in a kind of "energy pit". What does this mean? And the fact that the total number of particles received from its own Nucleus is already small, due to the distance. And the number coming from the neighboring giant body is so small that you can't take it into account. Of course, we are not talking about the peculiar group of constellations receiving the full radiation from two Nuclei simultaneously.

The ratio of radiations at the Solar Signs of the element Air in the greatest extent is shifted to the higher plans. This means that mainly the upper chakras are developed, but in general, even less than at signs of all other elements.

This shift to the chakras of upper level leads to a curious situation. It is these energy centers receive the greatest impulse to the development, since they are opened most of all and felt by human in the greatest extent. And he (she) inevitably becomes an intellectual, so the remaining undeveloped chakras did not distract from the mental activity.

These signs in some way are pariahs among the zodiac signs. Excessive pedantry, dry and melancholy emanate from their astrological characteristics. Nobody wants to be such.

Astrologers are right largely. Air signs (in western astrology this is Earth) really have to exert more effort than the signs of other elements to fully perceive the world around them. Ability to express their thoughts and feelings, to be spontaneous and active, is weakened at them. They have to make an effort to interact with the environment in the greatest extent.

25. ASPIRINGS, DISCIPLES, INITIATES, WORLD SERVANTS, WORLD SAVIORS

In the book of Alice Bailey "Esoteric Astrology" Djwhal Khul passes through her the following information.

He talks about *Aspirings* to the Initiation, *Disciples*, *Initiates*, *World Servants* of humanity and its *Saviors*.

Who are they, and what do we mean?

Here again we need to refer to the teaching of the chakras.

Disclosure in the human body (or any other creature) of the power centers of the upper levels leads him on the path of initiation, from an Aspiring to the status of World Server, and then to the World Savior.

In the book of Alice Bailey the Solar Signs Scorpio and Aries correspond to the status of Aspiring to initiation.

The Disciple is a sign of Sagittarius.

The Initiate – is Capricorn.

The World Servant – is Aquarius.

And finally, the World Savior - is Pisces.

What are the principles for this classification?

It's depending on the level of stimulation and development of the chakras related to the higher plans.

Than in greater extent upper energy centers are uncovered, the further the human has gone along the path of Initiation in the direction of the Savior of the World.

The purpose of any living creature – is to maximally develop all chakras of plans and levels.

But as the centers of the human associated with the physical, astral and mental (its lower levels) Plans already made significant evolutionary progress, when he was in a state mineral, plant and animal, its main task - is to use the chakras of the Buddhic Plan.

These centers – are Ajna (corresponding pituitary), head (zone of epiphysis) and Alta (in the medulla oblongata).

For this purpose, a birth in a number of zodiacal constellations is ideal.

Using the astrological influence with the so-called "genetic", i.e. with the karma of past lives, a person can achieve great heights in the progress towards the development of the higher chakras – i.e. on the path of Aspirants, Disciples, Initiates, World Servants and Saviors.

This is an experience of "mountain peaks".

But why the signs mentioned above correspond to the "working positions" in a hierarchical work? Why are Aries and Scorpio – the Aspirants, Sagittarius – the Disciple, Capricorn – the Initiate, Aquarius – the World Servant and Pisces – the World Savior?

The explanation is following.

But above all, it should be recalled that in the book of Alice Bailey "Esoteric Astrology" at enumerating of the signs the changes that have taken place in the firmament are not taken into account.

If we talk about the old astrological scheme, which was used on the early days of astrology, then yes, it is true, all is as it is indicated in Esoteric Astrology. However, due to the displacement of signs regarding the calendar, as well as of the projection of the Nucleus of Galaxy, everything is changed.

But before we start to name the new Sins corresponding Aspirants, Disciples and so on, let's analyze the old scheme, and try to understand why it looks that way.

Among the three giant celestial bodies, affecting by their radiation on our planet, the Central Body has the highest level of spirituality. It stimulates in the greatest extent the higher chakras, compared with the other two "Nuclei", as well as our Sun.

We will list the signs by the scheme:

Scorpio (Aspirant), Sagittarius (Disciple), Capricorn (Initiate), Aquarius (World Servant), Pisces (World Savior).

This is the Solar Signs. And opposite constellations indicating the position of the planet on the orbit are:

Taurus, Gemini, Cancer, Leo and Virgo.

Now you are aware of the fact that Virgo, Leo, Cancer and Gemini – are the constellations, just pointing to the projection on the central Body, i.e. on a source of spiritual radiation. Moreover, from Gemini to Virgo the intensity of radiation increases.

If we talk about the Solar Signs, these are Sagittarius, Capricorn, Aquarius and Pisces – it is in this order the concentration of the particles of higher Plans, affecting the planet at this time of year, increase. Hence the corresponding names.

Sagittarius - only starts the learning of higher mysteries – it is the Disciple.

Capricorn – school graduate, the Initiate.

Aquarius - is a servant, worker. The World Servant.

Pisces - is a professional. It is immersed in the process of ascension of humanity. The World Savior.

The "echoes" of this influence is coming to Taurus from the central Body (the Solar Sign - Scorpio). But it's not enough. Therefore, Scorpio just begins to feel the desire to everything otherworldly, unearthly. It is the Aspirant.

However, we should not assume that every Sagittarius - is Aspirant, every Sagittarius - is Disciple, Capricorn - is necessarily Initiate, etc. Not at all.

And the reverse situation is also true. Not every Savior - is Pisces, and not every Servant – is certainly born under the sign of Aquarius. The same can be said of Aspirants, Disciples and Initiates. They may be on any signs. Although it is recognized, that the general rule is as follows. And the percentage of Saviors yet is the largest among Pisces, and of Servers – among Aquarius. And so on.

As you can see, the changes in the sky led to the changes in the general scheme.

Earlier *Scorpio (Aspirant)* matched to the *end of October and also to the two ten-day periods of November*. Now Scorpio – this is time from mid-November to mid-December. I.e. those who were previously on the esoteric tradition attributed to the Disciples now are Aspirants.

Sagittarius (Disciple) fell at the *end of November and two ten-day periods of December*. Now it is replaced Capricorn. So, from mid-December to mid-January now not Capricorns are born but Sagittarians, classified as Disciples, not Initiates as it was earlier.

Capricorn (Initiate) matched before the *end of December and two ten-day periods of January*. And now it is from mid-January to mid-February - that is, just as Aquarians were born.

Aquarius (Servant) - as usual - it's the *end of January and two decades of February*. Now, under the new scheme, it is the former Pisces. From mid-February to mid-March.

Finally, *Pisces (Savior)*. Nice to meet you - now they are Aries - *mid-March - mid-April*.

As you can see, everything is pretty much shifted.

Moreover, we should remember that the Central Body emits equally in all directions. This means that it does not have additional radiation and main. It just main - and it is in both sides of the constellation Virgo. And so to the categories listed above, we should include another group of constellations.

There are also Libra, Scorpio and Sagittarius. And if we will turn and name the Solar signs, they will be Aries, Taurus and Gemini. Plus additionally we must take into account Capricorn (Cancer), because the

“echo” of the radiation reaches and this sign - as in the case with Taurus (Scorpio).

So it turns out, that another sign – *Aspiring* to mysteries - it's *Cancer*, former Lion. More precisely, now, it's all those who are born from mid-July to mid-August.

The Disciple - is *Gemini – mid-June – mid-July*.

The Initiate – is *Taurus – mid-May – mid-June*.

Another World Servant – is *Aries* - from *mid-April to mid-May*.

As you can see, *Virgo- Pisces - mid-March - mid-April* - is in the middle between the two groups. If you remember - it was projected on the Central Body. More precisely, Virgo is located in the same piece of the sky.

However, between categories of the first group of signs - Scorpio, Sagittarius, Capricorn, Aquarius, and of this group - Cancer, Gemini, Taurus, Aries - there's a little difference.

On the signs of the second group - Cancer, Gemini, Taurus and Aries – even one giant celestial body influences - the Nucleus of the Galaxy. And its influence is most the short-wave, the most material. It promotes the development of the lower chakras - the base of the spine and sacral. I.e. stimulates the basic instincts of survival and reproduction. I.e. the second group is a very interesting combination of higher spirituality and of most primitive motivation. This leads to very original and dramatic results - a powerful body and the development of higher will. These people are capable of extreme manifestations. For example, they can drink in the company of coarse hard workers, and at the same time to philosophize about the higher values. They may daily risk by their lives, and thus to see in this the true meaning of life. To work hard, and thus to empower their work and every day by the mystical significance.

But the signs of the first group – is a kind of sectarians. In the sense, that they overwhelmingly are focused on higher spirituality. They are not very concerned by the dense material needs of their bodies. I.e. they live by the principle “There is food and shelter - good. No – we do not die.” The main thing - it is a culture, fine, conscience, intuition,

inspiration. It is easier for them to achieve a high level of development of their higher chakras, rather than signs of the second group. They have no distractions - no demands of lower chakras. However, there is a downside. Because of this excessive aspiration to highest, they have usually mild and rather weak bodies, not capable to heavy loads.

Yet it should be noted that two signs from the first group - Scorpio and Sagittarius (former Sagittarius and Capricorn) are influenced by another gigantic celestial body – the Nucleus of Supergalaxy. And its radiation leads to the development of middle chakras of the body. For these signs are mainly the throat and the heart chakras. At Scorpio (former Sagittarius) they are stimulated greatly, while at Sagittarius (former Capricorn) are weak, but nevertheless the influence exists.

Here's the basic information relating to the scheme "Aspirants, Disciples, Initiates, World Servants and World Saviors".
