

This study sheet provides students and parents with the *basic concepts* of each chapter. Students still need to apply these skills in context. They need to know *when* to apply each concept, often after working through a word problem, table, chart, or graph. Some problems may be more challenging than the ones shown here, but students first need to understand these basic concepts. There are usually several ways to solve a math problem, but this guide will show you the easiest way for 6th graders. The sections are listed in the order that I plan on teaching them, and that is subject to change. We do not use every section of the textbook.

Click on the blue links to navigate through the study guide. You can also view videos at [Khan Academy](#) and [Virtual Nerd](#).

Section	Topic:	Common errors to avoid:	Try this problem on another sheet of paper:	Practice more at these websites:
2.1	Convert Fractions and Decimals			
<p>Converting Fractions to Decimals -Divide the numerator by the denominator.</p> $\begin{array}{r} 5 \\ 8 \overline{) 5.000} \\ \underline{40} \\ 60 \\ \underline{56} \\ 40 \\ \underline{40} \\ 0 \end{array} \quad 5 \div 8 = 0.625$ <p>Converting Decimals to Fractions -Say the number out loud.</p> <p>0.58 = "Fifty-eight hundredths" = $\frac{58}{100}$</p> <p>Then simplify to $\frac{29}{50}$</p>		<p>Don't forget to simplify!</p> <p>0.28 = "Twenty-eight hundredths" = $\frac{28}{100}$</p> <p>But, the answer choice will be in the simplest form of $\frac{7}{25}$</p>	<p>Convert $\frac{7}{20}$ to a decimal.</p> <p>Answer</p>	<p>Fruit Splat</p> <p>Super Hero Decimals</p> <p>Puppy Chase</p>
2.2	Compare and Order Fractions and Decimals			
<p>The <i>easiest</i> way to do compare and order fractions and decimals is to convert them all to decimals. Just divide the numerators by their denominators.</p> <p>Put these numbers in order from least to greatest:</p> $\frac{12}{20}, \quad 0.45, \quad \frac{2}{5}, \quad \frac{1}{2}, \quad 0.55$ <p>work: $12 \div 20 = 0.6$ <i>leave it</i> $2 \div 5 = 0.4$ 0.5 <i>leave it</i></p> <p>answer: $\frac{2}{5}, 0.45, \frac{1}{2}, 0.55, \frac{12}{20}$</p>		<p>Pay attention to the order that is being asked for.</p> <p>Is it least to greatest, or greatest to least?</p> <p>Read carefully.</p>	<p>Order these numbers from least to greatest:</p> $\frac{27}{30}, 0.84, \frac{41}{50}$ <p>Answer</p>	<p>IXL</p> <p>Scooter Quest</p> <p>Dolphin Racing</p> <p>Ordering (go to Options, & choose fractions or tricky decimals)</p>
2.3	Multiply Fractions			
<p>$\frac{3}{4}$ of $\frac{1}{2}$ means $\frac{3}{4} \times \frac{1}{2}$</p> <p>Just multiply straight across. $\frac{3}{4} \times \frac{1}{2} = \frac{3}{8}$ Then simplify if possible.</p> <p>If you multiply a fraction by a whole number, change the whole number to a fraction, with 1 as the denominator.</p> <p>$\frac{3}{4} \times 24 = \frac{3}{4} \times \frac{24}{1}$ That way, you have a numerator and a denominator, and you can multiply straight across, and simplify at the end.</p>		<p>Be sure to check that your answer is written in simplest form.</p> <p>Use you calculator to check!</p> 	<p>Find the product:</p> <p>$\frac{2}{3}$ of 48</p> <p>Answer</p>	<p>Snow Sprint</p> <p>Math Playground</p>

Section 2.4	Topic: Simplify before Multiplying	Common errors to avoid:	Try this problem on another sheet of paper:	Practice more at these websites:
<p>Regular way:</p> $\frac{3}{10} \times \frac{5}{27} = \frac{15}{270}$, but then you have to simplify. <p>Instead, you can use the “butterfly method” to simplify before multiplying. It’s an easy way to use mental math to multiply fractions.</p> <p>These can both be divided by 3.</p>  <p>These can both be divided by 5.</p>  <p>Then, just multiply straight across.</p> $\frac{1}{2} \times \frac{1}{9} = \frac{1}{18}$		<p>This only helps if you know your math facts!</p> <p>Keep practicing your multiplication and division facts.</p>	<p>Find the product. Simplify before you multiply.</p> $\frac{4}{7} \times \frac{7}{16}$ <p>Answer</p>	<p>Video 1</p> <p>Video 2</p>
Section 2.5	Topic: Model Fraction Division	Common errors to avoid:	Try this problem on another sheet of paper:	Practice more at these websites:
<p>$\frac{5}{6} \div \frac{1}{12}$ is asking “How many times does $\frac{1}{12}$ fit into $\frac{5}{6}$?”</p> <p>fits into</p>  <p>Draw what you have, and break it into the appropriate sized parts.</p>  <p>So the answer is 10.</p>		<p>Sometimes it is necessary to use pieces from more than one whole to form a fraction.</p> $2 \div \frac{2}{3} = 3$ 	<p>Use the model to find the quotient:</p> $\frac{3}{4} \div \frac{1}{8}$  <p>Answer</p>	<p>IXL</p> <p>Divide with Models</p> <p>Fraction Tiles</p>
Section 2.6	Topic: Estimate Quotients	Common errors to avoid:	Try this problem on another sheet of paper:	Practice more at these websites:
<p>Round each number, then divide with mental math.</p> $47\frac{7}{9} \div 8\frac{1}{3} \approx 48 \div 8 = 6$ Done!		<p>Don’t do all the tough work and then just round your answer.</p> <p>Instead, round <i>all</i> the numbers, and make it easy mental math from start to finish.</p>	<p>Estimate. Round before you divide.</p> $34\frac{7}{10} \div 5\frac{3}{8}$ <p>Answer</p>	<p>Choose the Sign</p>

Section	Topic:	Common errors to avoid:	Try this problem on another sheet of paper:	Practice more at these websites:
2.7	Divide Fractions	Only flip the 2 nd fraction (the divisor). The 1 st fraction never changes!	Find the quotient: $\frac{3}{4} \div \frac{1}{16}$ Answer	Math Playground Dividing Fractions
<p>Since we already know how to multiply fractions, we can just turn this division expression into a multiplication expression.</p> <p>Step 1: Flip the sign to multiplication. $\frac{3}{5} \div \frac{3}{10} \rightarrow \frac{3}{5} \times \frac{3}{10}$</p> <p>Step 2: Flip the 2nd fraction into its reciprocal (turn it upside down). $\frac{3}{5} \times \frac{3}{10} \rightarrow \frac{3}{5} \times \frac{10}{3}$</p> <p>Step 3: Mutliply across like normal. $\frac{3}{5} \times \frac{10}{3} = \frac{30}{15}$</p> <p>Step 4: Simplify if possible. $\frac{30}{15} = 2$</p>		<p>Problem: $\frac{1}{2} \div \frac{1}{8}$</p> <p>Wrong way: $\frac{2}{1} \times \frac{1}{8}$</p> <p>Right way: $\frac{1}{2} \times \frac{8}{1}$</p>		
2.8	Model Mixed Number Division	Sometimes it is necessary to use pieces from more than one whole to form a fraction.	Draw a model to find the quotient: $2\frac{1}{3} \div \frac{1}{3}$ Answer	Fraction Tiles Video
<p>$4\frac{1}{2} \div \frac{1}{2}$ means "How many times does $\frac{1}{2}$ fit into $4\frac{1}{2}$?"</p> <p>Draw what you have, then break it into the appropriate sized parts.</p>  <p>1 2 3 4 5 6 7 8 9</p> <p>So, the quotient is 9, because $\frac{1}{2}$ fits into $4\frac{1}{2}$ nine times</p>		<p>$2\frac{1}{4} \div \frac{3}{4} = 3$</p> 		
2.9	Divide Mixed Numbers	Don't forget to flip the sign to multiplication!	Find the quotient: $9\frac{3}{4} \div 3\frac{1}{4}$ Answer	Math Man Mixed to Improper
<p>Make both numbers into fractions. One or both may be improper fractions. That's ok! We can simplify at the end.</p> <p>$5\frac{3}{5} \div 2\frac{1}{2} = \frac{28}{5} \div \frac{5}{2}$</p> <p>Then change it to a multiplication problem, and flip the 2nd fraction to its reciprocal.</p> <p>$\frac{28}{5} \div \frac{5}{2} = \frac{28}{5} \times \frac{2}{5}$</p> <p>Then multiply straight across, and simplify.</p> <p>$\frac{28}{5} \times \frac{2}{5} = \frac{56}{25} = 2\frac{6}{25}$</p>		<p>Also, only flip the 2nd fraction (the divisor) to form its reciprocal.</p>
