Multi-task machining - tooling possibilities

Coromant Capto® – the connecting link to multi-task machining

A tooling system for multi-task machines has to transmit satisfactory torque levels, be capable of high spindle speeds, have high bending strength with high precision couplings for repeatable accuracy. Pre-measurement and setting should be possible outside the machine.

Coromant Capto® has a proven record of fulfilling all the requirements for the large variation of operational demands in these machines involving stationary and rotating tools. With its broad programme of turning, milling and drilling tools, using the same self-centering tool-coupling for a very broad application area, the system has been successfully equipped in all the major multi-task machines.

Clamping units for turning

Standard turret heads for lathes can easily be converted to Coromant Capto® modular quick-change system by using standard clamping units. See page G6.

CoroPlex™ – Innovative multifunctional tools

For taking advantage of versatile multi-task machine tools and to optimize their efficiency, there is now a demand for running them with dedicated tooling. The CoroPlex™ tools are designed for multi-task machining giving:

- accessibility, stability and higher productivity
- reduced tool changing time
- saved tool pocket in tool magazine
- cost reduction - one tool replaces many tools

CoroPlex™ MT – one milling and four turning tools in one

CoroPlex™ MT is a combination of two winning concepts in one – CoroMill® 390 and CoroTurn® 107. It is either applied rotating as an effective tool for milling applications – or indexed in a number of optional positions for stationary turning, external and internal, using two different CoroTurn® 107 inserts. See page A9.

For ordering CoroMill 390 inserts, see chapter D, Milling.

CoroPlex™ TT twin tools – two turning tools in one

CoroPlex™ TT twin tool is a rotating solution with two turning inserts in one holder allowing for the quick changing of tooling operations by a quick indexing of the tool.

CoroPlex™ SL mini-turret – four turning tools in one

Build your own multi-functional tool by using Coromant Capto® tool adaptor and apply a CoroPlex™ SL mini turret adaptor plate to be combined with four SL cutting heads and blades for turning, threading or grooving operations. See page G6.

Multi-task machining - tooling possibilities

Turning tools

For general turning the T-Max P system with negative inserts and CoroTurn® 107 with positive inserts forms the basis for high productivity turning. In parting and grooving the first choice is the CoroCut® system and in threading the best option is the CoroThread® 266 or T-Max U-Lock® system. See chapters A, B and C.

Milling tools

In the CoroMill® family there is always a milling cutter to fit your needs perfectly. The CoroMill® family is a multi-purpose milling system for use in applications such as face, shoulder, slot and profile milling. See chapter D, Milling.

Hole making tools

The drilling and boring programme, CoroDrill® and CoroBore®, offers a wide range of high performance hole making products. Regardless of the hole style – we can offer you the right tool for the best productivity in a wide diameter range. See chapter E, Drilling and Boring.

Tool holders and tool adaptors

Modern machines and tools put greater demands on tool holders. Low run-out is required to achieve long tool life. Hydro-Grip® fulfills all the demands on a tool holder. Different types of tool adaptors are available to help in building a correct tool length. See chapter G, Tooling systems in this catalogue and Tooling systems in the Main Catalogue for milling and drilling tools.

Accessories

Sandvik Coromant offers a range of accessory tools for the various coupling sizes, which are strongly recommended for setting important parameters such as spindle orientation, clamping forces etc. See chapter G, Tooling systems in this catalogue and Tooling systems in the Main Catalogue for milling and drilling tools.

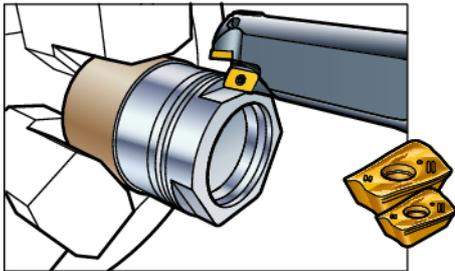

CoroPlex™ MT

Multifunctional milling and turning tool

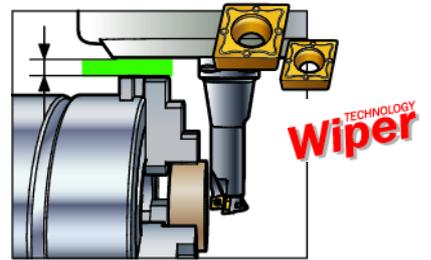

Many optimized tools in one solution dedicated to multi-task machining.

... as a CoroMill® 390 cutter

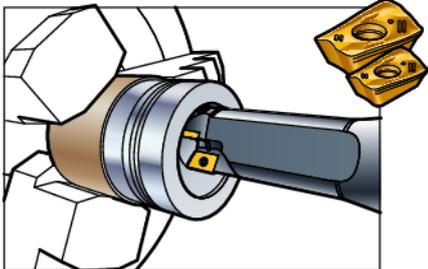

Shoulder milling

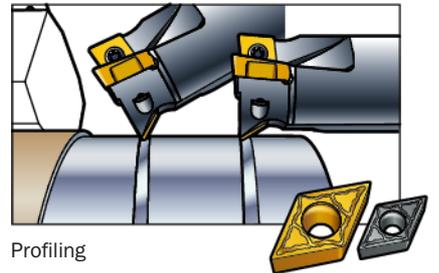

...as a CoroTurn® 107 tool

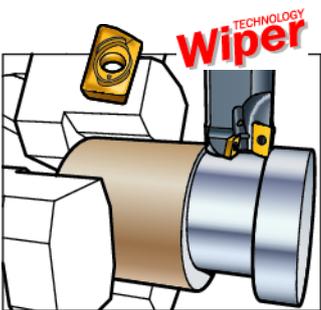

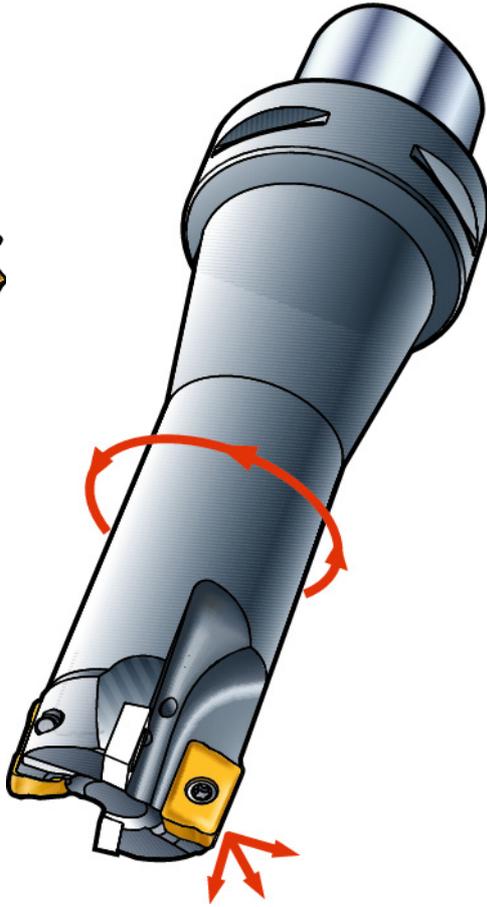

Face and longitudinal turning

Circular interpolation in helix

- 1) γ = Rake angle (valid with flat insert).
- 2) λ_s = Angle of inclination.
- 3) n_{max} (max. rev/min) for holders must also be considered.

Limitation on workpiece diameter

When turning axially and using the CCMT insert, it may be that the R390 inserts, because of their position in the tool, limit the workpiece diameter. See illustration below.

For ordering CoroMill 390 inserts, see chapter D, Milling.

Tool diameter, D_c mm (inch)	Max workpiece diameter, D_m mm (inch)			
	Insert type	R390-11	R390-18	Wiper R390-11

One and the same tool for rotating and stationary use

The CoroMill® 390 inserts are positioned a little ahead of the CoroTurn® inserts – axially as well as radially – to guarantee that turning inserts are not in cut when the tool is applied rotating. This means that turning of an available blind hole – using the CoroTurn® function of the tool – must be stopped before the CoroMill® 390 inserts get in contact with bottom face.

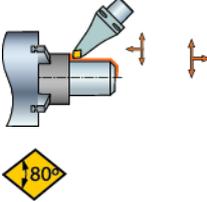

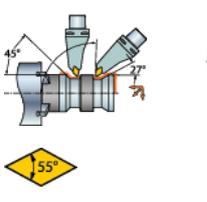

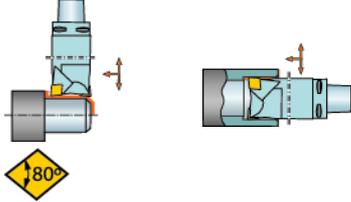

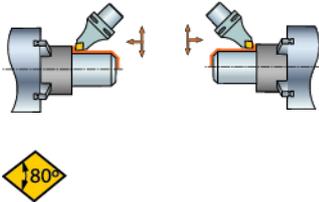

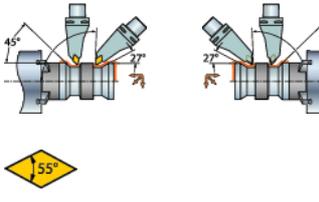

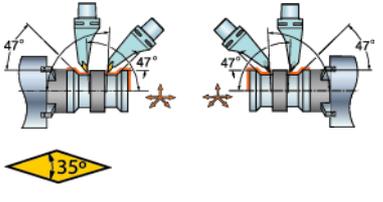

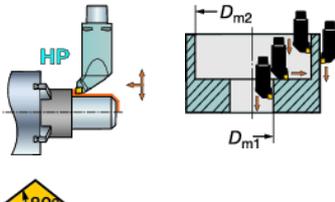

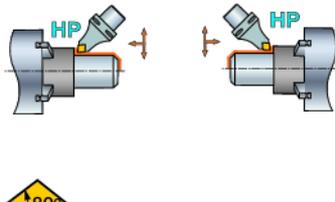

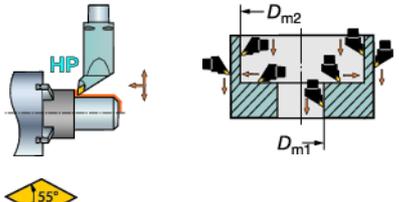

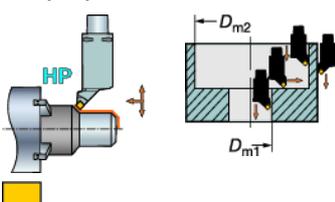

Tool length optimized for accessibility in multi-task machining

The tool bodies are extended by 65 mm (2.60 inch) compared to corresponding conventional tools – to allow freer use of the working positions possible in multi-task machining – without any need for extensions.

Length and design of the tool body is optimized by each Coromant Capto® size to provide best accessibility relative to the most common chuck sizes. The tool is designed with all inserts positioned on the centre line of the tool, to be easy to use together with the standard programme cycles in the machine tools.

 General information

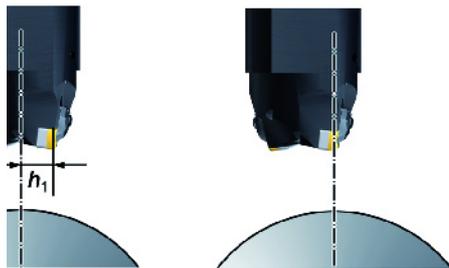

CoroPlex™ TT

Multifunctional turning tool

Two turning tools in one dedicated to multi-task machining.

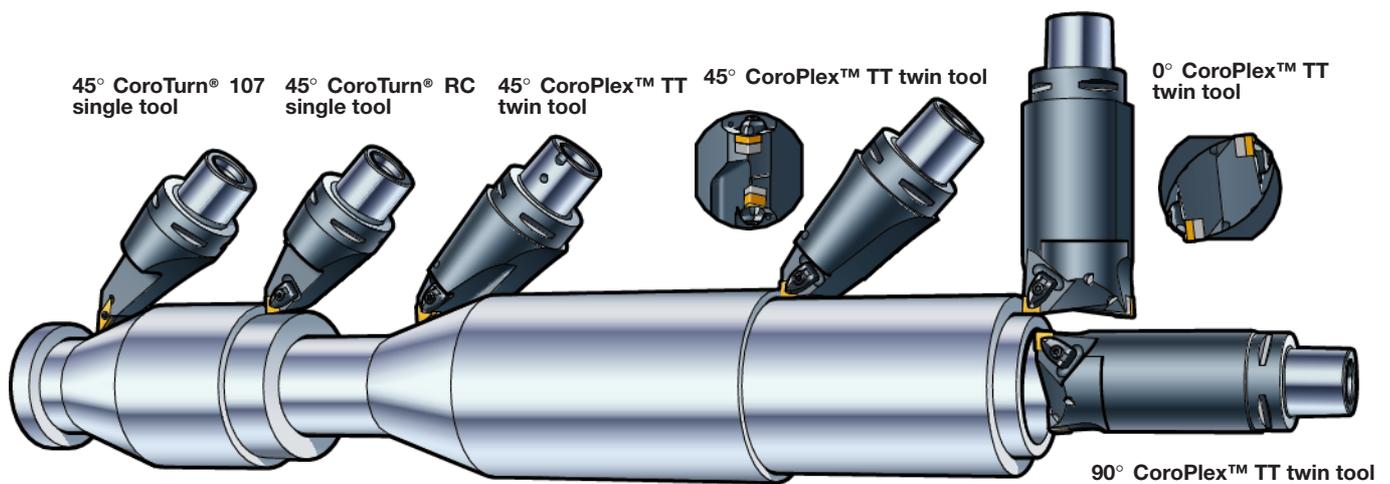

CoroPlex™ TT twin tool combines two tool holders in one:

- Reduced tool changing time.
- Saved tool pockets in the tool magazine.
- Flexible tool holders optimized in length, stability and coolant solution for multi-task machines.
- CoroTurn® RC insert clamping system with wide flexibility.
- One holder replaces two - cost reduction.

To apply the twin tool, move the Y-axis the distance h_1 , so that the insert will cut on the centre line of the workpiece. When working against a sub-spindle, the Y-axis must be offset in the opposite direction in relation to the main spindle.

Flexibility with multi-task machining

CoroTurn® HP

Coromant Capto tools for High Pressure coolant

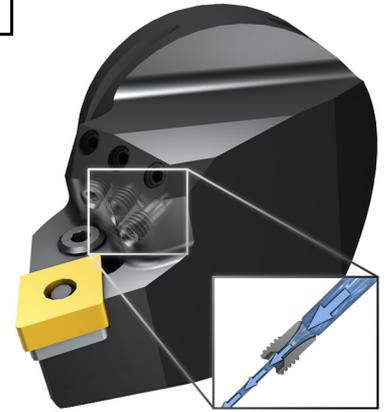

Increased cutting speed for rough to medium machining
Chip control in finishing - secure unmanned production

When to use

Any turning machine where both high pressure coolant and Coromant Capto® coupling are available:

- Multi-task machines
- Vertical turning lathes (VTL)
- Turning centres

The characteristic reduced depth of cut and reduced feed rate in finishing operations always leads to challenges for chip control. In automated production, be it high volume mass production or machines with automatic tool changing (multi-task and vertical turning lathes), any chips gathering around the tool will result in costly machine stoppages. This new technology will provide you with total chip control giving security in unmanned production.

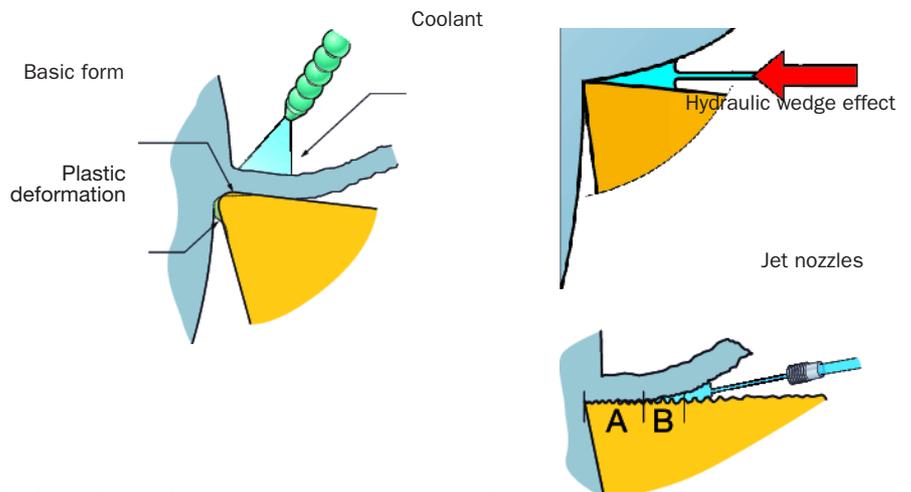

Fixed coolant-nozzle technology

The high pressure coolant application by way of CoroTurn HP is based on carefully developed nozzle technology based on decades of experience. Optimized nozzles give parallel laminar jets of coolant with high velocity accurately directed at the right place on the insert. The precision and character of these jets make the difference. CoroTurn HP has fixed, pre-directed, high precision nozzles mounted on the tool targeting the right place, at the right angle on the cutting edge. No setting with trials is needed, performance and security is built in with only normal tool maintenance required.

A directional jet for maximum effect

The principle of turning with high pressure coolant is to accurately position the jet of coolant through small, sighted nozzles (dia 1 mm) to give a parallel laminar flow. This high velocity jet of coolant creates a hydraulic wedge between the top surface of the insert and the underside of the chip being removed from the component. The coolant jet has three main effects:

1. To provide localized cooling of the insert in the contact zone (A)
2. To force the chip away from the insert face quickly, reducing wear on the insert (B)
3. To help break the chip into smaller pieces and evacuate it from the cutting area

CoroTurn HP tools for general turning, see page A110.
