Unit 7: MEIOSIS PACKET

This packet is designed to help you understand several concepts about Cell Division.

As you practice the exercises on each handout, you will be able to:

- Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring. (HS-LS3-1)
- Describe the identifying features of the stages of meiosis I and meiosis II. (HS10-LS3-1.1)
- Describe the role of meiosis in producing gametes and its significance to genetic diversity. (HS10-LS3-1.2)
- Compare and contrast Meiosis & Cell Division (HS10-LS3-1.3)

Record this packet in the Table of Contents for Unit 7. This will be the next "HANDOUT."

In order to be considered alive, certain requirements must be met. One of these requirements is reproduction: the ability to create offspring. Meiosis is one way living things produce offspring. During Meiosis, a series of steps must be followed in a particular sequence. Each step is unique and important in its own way. Understanding each step will increase your understanding of this type of reproduction.

Objectives:

The purpose of this video is to provide information so that students can:

- Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring. (HS-LS3-1)
- Describe the identifying features of the stages of meiosis I and meiosis II. (HS10-LS3-1.1)
- Describe the role of meiosis in producing gametes and its significance to genetic diversity. (HS10-LS3-1.2)

Directions:

- 1. **FUN NOTES**: Use as a resource as you watch the video.
- 2. Go to the class website: thsclaybio.weebly.com
- 3. Click Semester #2.
- 4. Scroll down to Unit 7: Meiosis.
- 5. Click the button: Video #1: Meiosis Sexual Reproduction
- 6. Turn on the closed captioning by clicking:
- 7. Watch the video at least 1 time without stopping.
- 8. As you answer the questions that follow, PAUSE and REWIND OFTEN!

The questions below are designed to explain important concepts about the stages of Meiosis. Answer each question. **INCLUDE DETAILS!**

- 1. What is the purpose of meiosis? What does meiosis generate and for what purpose?
- 2. Describe the characteristics of the parent cell and the daughter cells produced during meiosis.
- 3. **PAUSE THE VIDEO:** Using the information from questions #2, answer this question: If a diploid cell containing 20 chromosomes experiences meiosis, how many chromosomes will each daughter cell have?
- 4. In order for the correct # of chromosomes to make it into the daughter cells at the end of meiosis, how many times must the cell divide (experience cytokinesis)?
- 5. Even though cell division and meiosis look very similar, there are some very distinct differences between these two processes. Of these differences, what are the 2 major events that occur during meiosis that lead to genetic diversity? (make sure to include the event with details & the stage of meiosis)

- 6. **PAUSE THE VIDEO:** DRAW a picture of the events occurring in question #5 to clarify your description.
- 7. What are the identifying characteristics of each stage of meiosis (I and II)?

8. If 2 parents have more than one child, why are the children not identical to one another?

Objectives:

The purpose of this activity is to provide information so that students can:

- Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring. **(HS-LS3-1)**
- Describe the identifying features of the stages of meiosis I and meiosis II. (HS10-LS3-1.1)
- Describe the role of meiosis in producing gametes and its significance to genetic diversity. (HS10-LS3-1.2)
- Compare and contrast Meiosis & Cell Division (HS10-LS3-1.3)

Directions: Use the notes, textbook (pgs. 270-276) and instructor as a guide for this activity.

- MODEL: Use the poster & envelope, set up each stage of Cell Division (begin with Interphase).
- <u>ANSWER</u>: On a separate sheet of paper, answer <u>all 9 questions</u> about each stage.
- 1. What stage of Meiosis is this?
- 2. Does this stage have a nuclear membrane?
- 3. If this stage has a nuclear membrane, is the nuclear membrane in pieces or one piece?
- 4. How many chromosomes are there in this stage?
- 5. How is the DNA organized in this stage? (chromatin, chromosomes, chromatid pairs or homologous chromosomes)?
- 6. Where is the DNA located in this stage (in the nucleus, middle of the cell, opposite sides of the cell)?
- 7. Where are the centrioles located in this stage?
- 8. Where are the spindle fibers located in this stage <u>AND</u> what are the spindle fibers doing?
- 9. Is this cell diploid or haploid?
- 10. What is the purpose of Meiosis?
- 11. Write the name of each stage described on the "Stage Identification Cards" on the back of this page.
- **CHECK:** Show answers to Questions #1-10 to the instructor & **GET INITIALS** in the table below.
- <u>GOAL</u>: PASS OFF <u>ALL</u> THE STAGES OF MEIOSIS (Part 1 & Part 2).

Stage of Meiosis I	Q#1	Q#2	Q#3	Q#4	Q#5	Q#6	Q#7	Q#8	Q#9	Q#10	Q#11 CARD

Stage Name: _____

<u>DIRECTIONS</u>: Answer the questions below.

1. Identify each stage of Meiosis represented in the pictures below.

- During meiosis, a parent cell with 20 chromosomes will produce _____ daughter cells each with _____ chromosomes. Therefore, the purpose of Meiosis is to produce _____ daughter cells each with _____ the number of chromosomes as the parent cell.
- 3. The cells produced during Meiosis are called ______ (sex cells) and are involved in

_____ reproduction.

Meiosis Virtual Lab

Introduction:

Meiosis is the second important kind of nuclear division. It resembles cell division in many ways but the products of meiosis are different from the products of cell division. While cell division may occur in almost any living cell of an organism, meiosis occurs only in specialized cells involved with sexual reproduction. In animals, meiosis is restricted to cells that form **gametes** (eggs and sperm).

Each species has a characteristic number of chromosomes per somatic cell. Fruit flies have 8; normal humans have 46. These chromosomes exist as homologous chromatid pairs that are similar in size and shape and carry the same kinds of genes. Thus humans have 23 homologous pairs. The full complement of 46 chromosomes is referred to as the **diploid number** (2 copies of each chromosome).

In sexually reproducing organisms, when an egg is fertilized, the egg and sperm fuse to form a single cell called a **zygote**. The zygote then develops into a new organism. If the egg and sperm were both diploid (46 chromosomes each in the case of humans), then the resulting zygote would be tetraploid (4 copies of each chromosome). This would result in the organism receiving too much DNA, so a mechanism has evolved to insure that each gamete (egg or sperm) contains only one copy of each homologous pair (or half the diploid number). This is referred to as the **haploid number**.

Haploid Egg + Haploid Sperm = Diploid Zygote

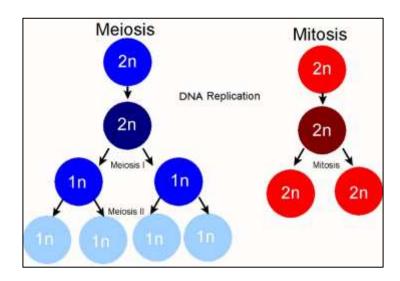

The process that makes haploid gametes is called meiosis. Meiosis consists of two divisions, **Meiosis I** and **Meiosis II**, and produces four daughter cells each with ½ the # of chromosomes as the original parent cell (see diagram). The DNA is copied once during Interphase. The stages of meiosis that follow are named like the stages of cell division (prophase, metaphase, anaphase, telophase) but as we shall see the events are somewhat different.

Objectives:

- 1. Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring. (HS-LS3-1)
- 2. Describe the identifying features of the stages of meiosis I and meiosis II. (HS10-LS3-1.1)
- 3. Describe the role of meiosis in producing gametes and its significance to genetic diversity. (HS10-LS3-1.2)
- 4. Compare and contrast Meiosis & Cell Division (HS10-LS3-1.3)

Materials:

- Computer
- Lab Sheet

Procedure and Data:

- 1. Read the introduction. Answer the questions (use complete sentences), and GET INSTRUCTOR INITIALS.
 - a) What is meant by "diploid number"?
 - b) Why do gametes need to be haploid?

c) How does meiosis create haploid gametes?

- 2. Open the web browser and go the class website: thsclaybio.weebly.com
- 3. Click on the Button: Virtual Lab: Meiosis
- 4. Skip the online introduction and click "Begin Assignment."
- 5. Part I asks you to review the stages of meiosis from the textbook. Use the diagrams on page 273 <u>AND</u> your notes to:
 - Review the stages of meiosis (meiosis I and meiosis II).
 - Make sure you can identify each stages using the identifying characteristics listed below.
 - Is there a nuclear membrane?
 - Is the nuclear membrane in pieces or one piece?
 - How is the DNA organized? (chromatin, chromosomes, chromatid pairs or homologous chromosomes)?
 - Where is the DNA located in this stage (in the nucleus, middle of the cell, opposite sides of the cell)?
 - Where are the centrioles located in this stage?
- 6. Click "Begin Part 2."
- 7. Click "Click here to begin."
- 8. Read the Part II instructions and complete the Meiosis I section. <u>Draw</u> and <u>label</u> what the plant sex cells look like at each stage of Meiosis I. (If there is a stage that is not represented, use your notes to help you with the drawing of that stage.)
 - nuclear membrane

• cell plate (if applicable)

• cell membrane

- DNA (chromatin/chromosomes/homologous chromosomes)
- ** <u>Interkinesis</u>: In this module, interkinesis is a stage where the nuclear membrane reassembles and the cell plate forms. Include this stage as part of telophase. **

Table 1: Stages of Meiosis I

Interphase	Prophase I	Metaphase I	Anaphase I	Telophase I	Cytokinesis I

** <u>Interkinesis</u>: In this module, interkinesis is a stage where the nuclear membrane reassembles and the cell plate forms. Include this stage as part of telophase. **

9. Click "here."

10. Repeat the process with the Meiosis II cells. <u>Draw</u> and <u>label</u> what the plant sex cells look like at each stage of Meiosis II. (If there is a stage that is not represented, use your notes to help you with the drawing of that stage.)

• nuclear membrane

• cell plate (if applicable)

• cell membrane

• DNA (chromatin/chromosomes/homologous chromosomes)

** <u>Interkinesis</u>: In this module, interkinesis is a stage where the nuclear membrane reassembles and the cell plate forms. Include this stage as part of telophase. **

Table 2: Stages of Meiosis II

Prophase II	Metaphase II	Anaphase II	Telophase II	Cytokinesis II				
<u>REMEMBER</u> : IN	<u>REMEMBER</u> : IN MEIOSIS II, THERE ARE 2 CELLS EXPERIENCING EACH STAGE AT THE SAME TIME TO							
	PRODUCE 4 DAUGHTER CELLS AT THE END OF CYTOKINESIS II.							

- 11. Click "Begin Part 4." (really it takes you to part 3 it is a typo in the module)
- 12. **BEFORE BEGINNING PART 4**, answer this question and <u>GET INSTRUCTOR INITIALS</u>:
 - What is a karyotype and what information can you get from looking at a karyotype (use page 311)?

13. Complete at least case studies #1-4 of the cytogeneticists. Record the gender/ karyotype and the diagnosis for each case studies.

Case #	Gender (Male XY or Female XX)	Karyotype	Diagnosis Description
1			
2			
3			
4			

14. Answer the questions in the Conclusion section below.

Conclusion:

Answer the following questions using complete sentences. Include details to demonstrate your mastery of the concept of Meiosis.

- 1. What is the purpose of meiosis? (be specific) Use these "sciency" words:
 - haploid

• daughter cells

gametes

• diploid

parent cell

2. Create a Venn Diagram to describe the similarities and differences between cell division and meiosis?

Cell Division	Meiosis

- 3. In which stages of meiosis are the cells considered haploid?
- 4. In which stages of meiosis are the cells considered diploid?
- 5. Considering humans are diploid organisms 2n=46, how many chromosomes would you expect to find in human gametes?
