F. Finding The Custom URL Scheme Of An iOS App.....	6

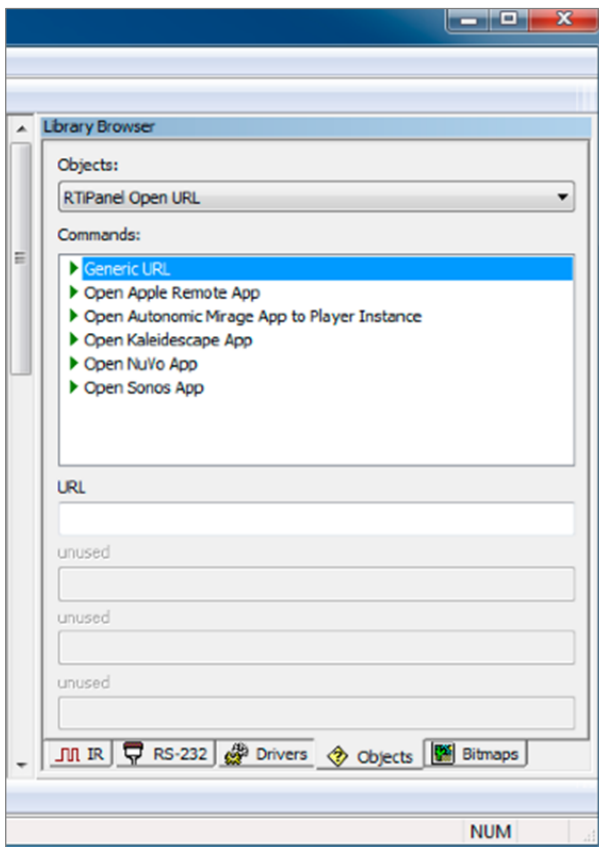

A. Overview

A URL scheme allows users to open other Apps from the RTiPanel GUI on an iOS Device.

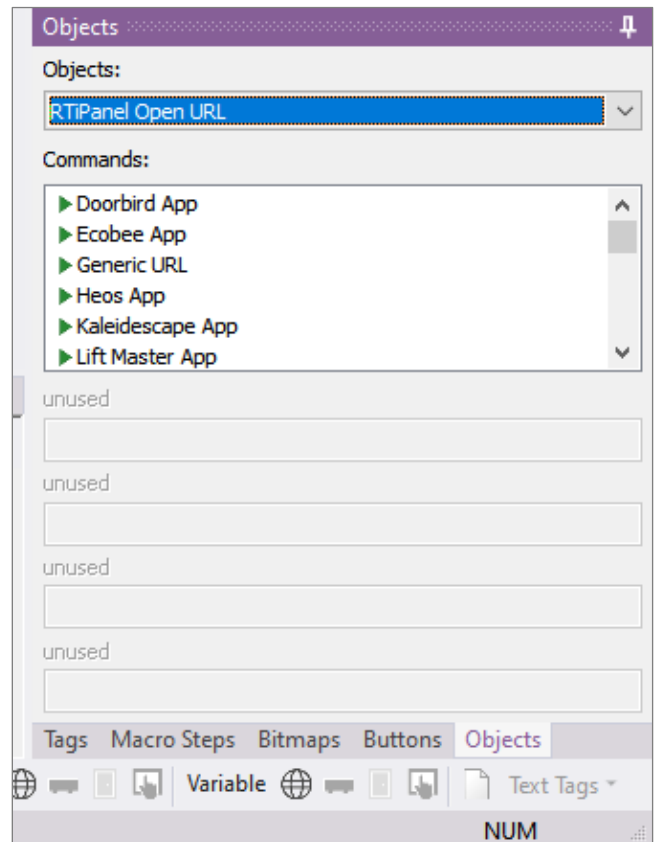

B. Getting Started

1. Click on the **Objects** tab at the bottom right corner of the ID9 library manager or APEX main window.
2. Select **RTiPanel Open URL** from the drop-down menu.
3. Select the App you want to link and drag & drop it on a button of the User Interface

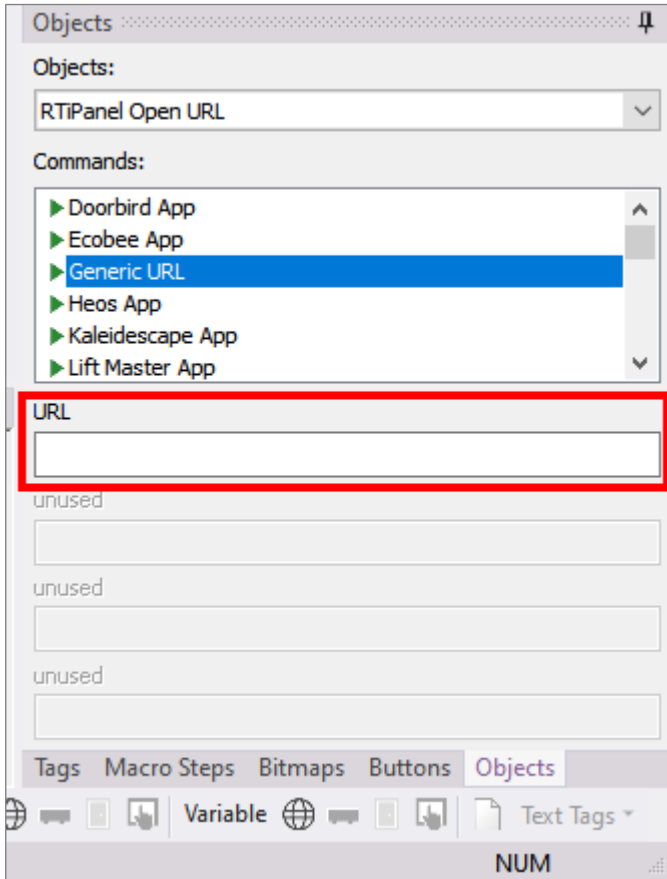

Integration Designer 9

Integration Designer 10 APEX

- If the App you are looking for is not listed select **Generic URL** and use a custom URL scheme

C. Testing Custom URL Schemes

URL schemes can also be tested in the Apple Safari browser. Enter the URL scheme and check if the App opens.

D. Popular URL Schemes

F. Finding The Custom URL Scheme Of An iOS App

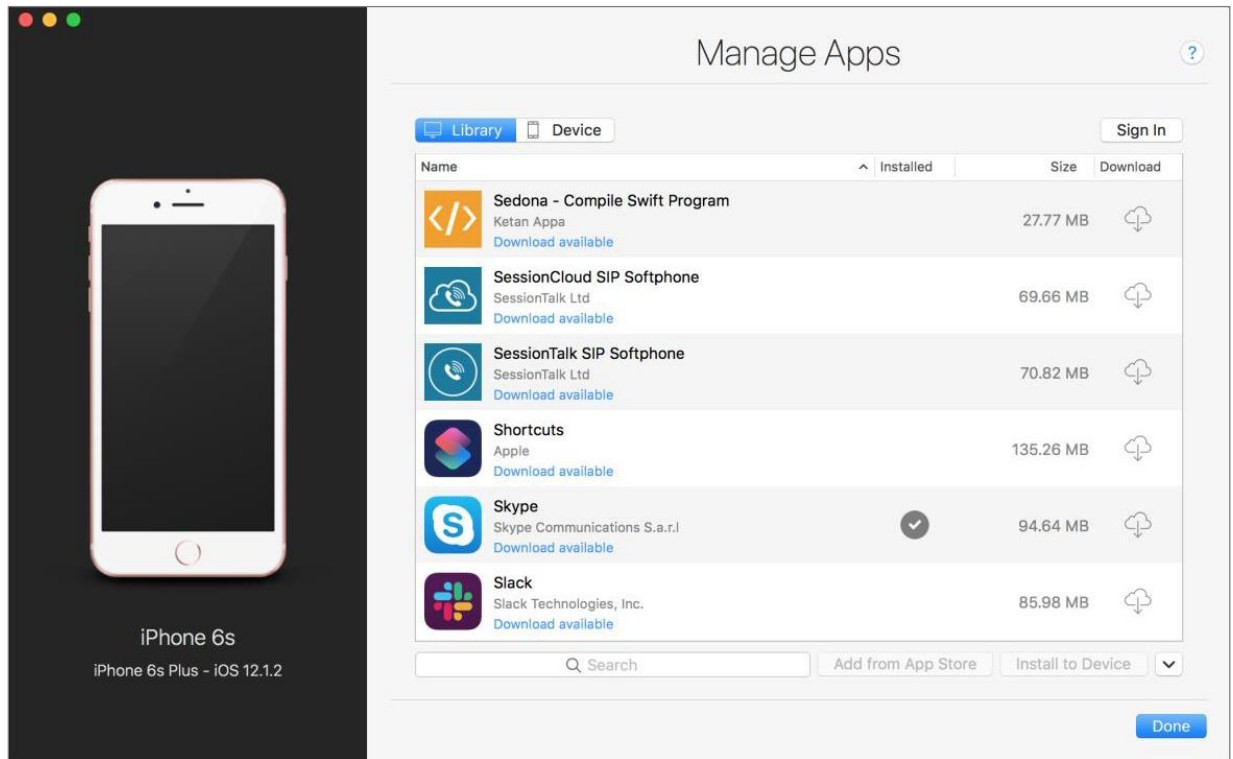

1. Downloading the IPA of the App

There are a couple of ways to download the IPA of an App available on the App Store. We have chosen to use the [iMazing MacOS App](#), because we think it's the most straightforward way of doing it. It is an iOS device management tool with a lot of great features and you should definitely check it out. These are the steps that you have to take:

- 1.1. Once you have downloaded and installed the App, open it and connect your iPhone with the app.
- 1.2. After the device is connected, you will be able to see the menu on the right side. From the menu select **Manage Apps**.

- 1.3. From the list of Apps in the **Library** tab select the app for which you want to download the IPA file and click the download button.

- 1.4. You will be prompted to sign in with your Apple ID. After you sign in, you will be able to download the App.
- 1.5. Once the download is finished, right click on the app and export the IPA file to your disk.

2. Finding the Custom URL Scheme

Downloading the IPA file was the hard part. Now you only need to extract the Info.plist file and find the URL scheme if it exists. To do this you have to do the following:

- 2.1. Change the file extension of the IPA file from .IPA to .zip.
- 2.2. Unzip the file.
- 2.3. In the unzipped file you will find the Payload folder. The folder should contain a .app file.
- 2.4. Right click on the .app file and select Show Package Contents.

- 2.5. In the resulting folder you will find the Info.plist file. If the URL scheme exists it should be stored under the **CFBundleURLSchemes** key of the property list:

```
<key>CFBundleURLTypes</key>
<array>
  <dict>
    <key>CFBundleURLSchemes</key>
    <array>
      <string>MyUrlScheme</string>
    </array>
  </dict>
</array>
```
