

Valence Bond Theory – H₂

- H₂ bonds form because **1s** atomic valence orbital from each H atom overlaps

23

Valence Bond Theory – F₂

- F₂ bonds form because **2p** valence orbitals overlap

24

Valence Bond Theory – HF

- HF involves overlaps between **1s** orbital on H and **2p** orbital of F

25

Conformations

- C—C single bond has free rotation around the C—C bond

- Conformations**
 - Different relative orientations on molecule upon rotation

26

Multiple Conformations of Pentane

27

Double and Triple Bonds

- So where do extra electron pairs in multiple bonds go?
 - Not in hybrid orbitals
 - Remember VSEPR, multiple bonds have no effect on geometry

Two types of bond result from orbital overlap

- Sigma (σ) bond
 - Accounts for first bond
- Pi (π) bond
 - Accounts for second and third bonds

28

Sigma (σ) Bonds

- Head on overlap of orbitals
- Electron density concentrated most heavily between nuclei of two atoms
- Lie along imaginary line joining their nuclei

29

Pi (π) Bonds

- Sideways overlap of unhybridized p orbitals
- Electron density divided into two regions
 - Lie on opposite sides of imaginary line connecting two atoms
- Electron density above and below σ bond.
 - Can never occur alone
 - Must have σ bond
 - π bonds allow atoms to form double and triple bonds

30

Properties of π -Bonds

- Can't rotate about double bond
- π bond must first be broken before rotation can occur

31

Your Turn!

How many σ and π bonds are there in $\text{CH}_2\text{CHCHCH}_2$

9, 2

32

Molecular Orbital (MO) Theory

1. Molecular orbitals are associated with entire molecule as opposed to one atom
2. Allows us to accurately predict magnetic properties and bonds of molecules
3. Energies of molecular orbitals determined by combining electron waves of atomic orbitals

33

Summary of MO from $1s$ AO

- **Bonding molecular orbital σ**
 - Electron density builds up between nuclei
 - Electrons in bonding MOs tend to stabilize molecule
- **Antibonding molecular orbital σ^***
 - Cancellation of electron waves reduces electron density between nuclei
 - Electrons in antibonding MOs tend to destabilize molecule

34

MO Energy diagram for H₂

Copyright © 2012 John Wiley & Sons, Inc. All rights reserved.

- H₂ is very stable molecule

35

Rules for Filling MO Energy Diagrams

- Electrons fill lowest-energy orbitals that are available
 - Aufbau principle applies**
- No more than two electrons, with spin paired, can occupy any orbital
 - Pauli exclusion principle applies**
- Electrons spread out as much as possible, with spins unpaired, over orbitals of same energy
 - Hund's rule applies**

36

Bond Order

- Measure of number of electron pairs shared between two atoms

$$\text{Bond Order} = \frac{(\text{number of bonding } e^-) - (\text{number of antibonding } e^-)}{2 \text{ electrons/bond}}$$

- As **bond order increases**, **bond length decreases**, and **bond energy increases**

- H₂ bond order = 1
- A bond order of 1 corresponds to a single bond

37

MO Energy Diagram for He₂

- Four electrons, so both σ and σ^* molecular orbitals are filled

- Bond order = $\frac{2 - 2}{2} = 0$

- There is no net bonding
- He₂ **does not form**

38

MO from 2p Orbital

Li₂ → N₂
 π_{2p} Lower in energy than σ_{2p}

O₂, F₂ and Higher σ_{2p}
 Lower in energy than π_{2p}

40

MO Energy Diagram for Li₂

π_{2p} Lower in Energy than σ_{2p}

Li electron configuration = [He]2s¹ 1 ve

$$\text{Bond order} = \frac{(2 - 0)}{2} = 1$$

Li – Li single bond
Diamagnetic as
no unpaired spins

MO Energy Diagram for Be₂

π_{2p} Lower in Energy than σ_{2p}

Be electron configuration = [He]2s² 2 ve

$$\text{Bond order} = \frac{(2 - 2)}{2} = 0$$

Be – Be no net bond
∴ does not form

MO Energy Diagram for B₂

π_{2p} Lower in Energy than σ_{2p}

B electron configuration = [He]2s²2p¹ 3 ve

$$\text{Bond order} = \frac{(4 - 2)}{2} = 1$$

B – B single bond
Paramagnetic as
2 unpaired spins

MO Energy Diagram for C₂

π_{2p} Lower in Energy than σ_{2p}

C electron configuration = [He]2s²2p² 4 ve

$$\text{Bond order} = \frac{(6 - 2)}{2} = 2$$

C = C double bond
Diamagnetic as no
unpaired spins

MO Energy Diagram for N₂

π_{2p} Lower in Energy than σ_{2p}

N electron configuration = [He]2s²2p³ 5 ve

$$\text{Bond order} = \frac{(8 - 2)}{2} = 3$$

N≡N triple bond
Diamagnetic as no
unpaired spins

MO Energy Diagram for O₂

σ_{2p} Lower in Energy than π_{2p}

O electron configuration = [He]2s²2p⁴ 6 ve

$$\text{Bond order} = \frac{(8 - 4)}{2} = 2$$

O = O double bond
Paramagnetic as
2 unpaired spins

MO Energy Diagram for F₂

σ_{2p} Lower in Energy than π_{2p}

F electron configuration = [He]2s²2p⁵ 7 ve

Bond order = (8 - 6)/2
= 1

47

MO Energy Diagram for Ne₂

σ_{2p} Lower in Energy than π_{2p}

Ne electron configuration = [He]2s²2p⁶ 8 ve

Bond order = (8 - 8)/2
= 0

48
