HUMAN FACTORS AND ERGONOMICS SOCIETY

WELCOME

Welcome to the HFES 2018 International Symposium on Human Factors and Ergonomics in Health Care. The symposium offers a unique program of human factors/ergonomics (HF/E) perspectives on health-care human factors, technology, and patient safety, divided among four main tracks:

- Clinical and Consumer Health-Care IT
- Hospital Environments
- Medical and Drug Delivery Devices
- Patient Safety Research and Initiatives

The meeting is designed to enable HF/E professionals to disseminate their science, principles, and best practices to the health-care product and provider communities, and to enable these communities to provide HF/E professionals with the proper context, requirements, and perspectives to better focus future HF/E efforts.

The 2018 program starts with our keynote speaker, Sorrel King. A nationally renowned patient safety advocate, King will focus how to create a culture of patient safety, based on her family's experience, as a tool to help inspire, educate, and create a call to action.

A panel on Monday from 1:30 to 3:00 p.m. honors the contributions of Robert Wears, MD, a leader in patient safety.

Gold Sponsor Ximedica will host a reception on Tuesday evening following the poster session. All attendees are invited.

We thank our symposium track chairs and their committee members for creating such a diverse and timely program. Special thanks also to our sponsors, exhibitors, advertisers, student volunteers, session chairs, and all the other individuals who supported the effort to produce this symposium.

We hope that this year's symposium will enable all attendees to reach new heights in applying the perspectives and science of human factors/ergonomics to the future of health care.

Workload Assessment: A Guide for Researchers, Practitioners, and Students

Volume 2, Users' Guides to Human Factors and Ergonomics Methods

Workload assessment is important wherever people perform under high levels of task demand, such as multitasking, time pressure, and interacting with complex interfaces. This accessible guide sets out a comprehensive, systematic approach to choosing and evaluating workload measures and to designing studies to maximize the value obtained from the measures.

No other single volume in the current literature deals exclusively with workload assessments. In this book, you'll find

- **Basic concepts in both workload theory and applications in a variety of domains**
- **A comprehensive survey of leading self-report, performance-based, and psychophysiological measures**
- **A checklist to ensure assessment quality**
- **Two detailed workload examples to illustrate practical applications.**

Workload Assessment has been written to be accessible to a wide audience and generally requires little specific background knowledge. This book will help guide **researchers** toward best practices in the use of workload measures to test theory-driven hypotheses in studies of cognitive psychology and cognitive neuroscience.

Practitioners in domains such as surface transportation, aerospace, industrial ergonomics, the military, cybersecurity, system design, education, and health care will be able to choose the most appropriate workload measures for applied problems, and use workload data in efforts to mitigate performance issues. *Workload Assessment* is essential reading for graduate **students** in human factors and applied cognitive psychology, as well as supplementary reading for undergraduate students in these topics.
