

What is new in Abaqus 2016

Marko Vrh

SIMULIA seminar

Ljubljana, 12.4.2016

Agenda

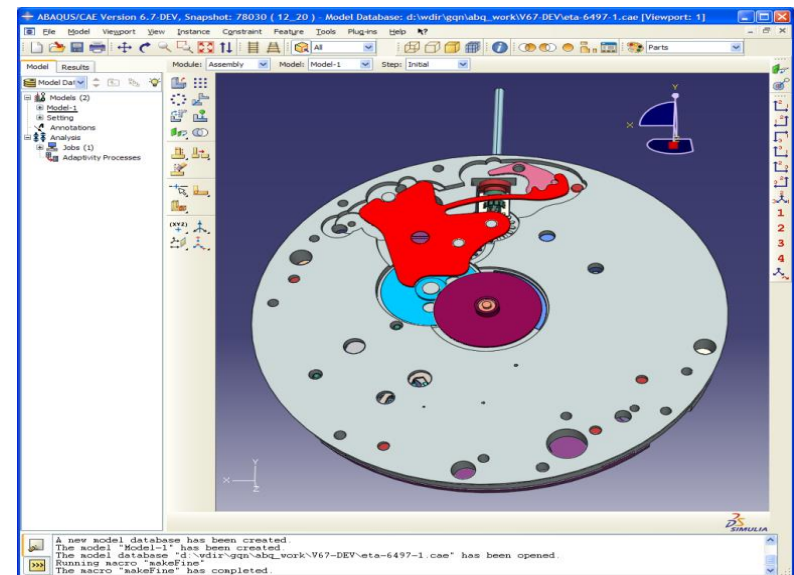

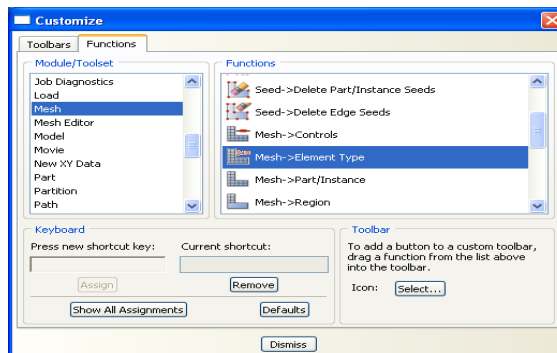

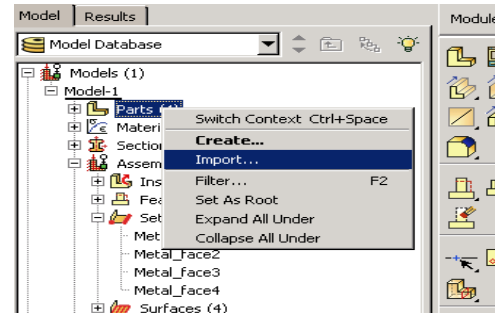

- Abaqus technical overview
 - Abaqus/CAE
 - Abaqus/Standard
 - Abaqus/Explicit
 - Abaqus/CFD
- Powerfull but frequently overlooked features
- Latest capabilities in Abaqus
 - CEL
 - SPH
 - DEM
- What is new in latest release Abaqus 2016

Abaqus/CAE

Abaqus/CAE

Modern graphical interface

- Modular & well organized
- Easy to learn & use
- Object-action paradigm
- Model Tree
- Customizable toolbars
- CAD-compatible view manipulation

Abaqus/CAE

Geometry & model import

- Create moderately complex geometry
- Import neutral CAD formats
- Associative CAD interfaces preserve analysis attributes when geometry changes
- Complete set of geometry repair tools

Bone geometry imported from STL file

CAD

Abaqus/CAE

Geometry repair toolset

Abaqus/CAE

Powerful & flexible meshing

- Fast, automatic free meshing
- Semi-automatic hex meshing
- Abstract away unimportant features using virtual topology

Automatic free mesh

Semi-automatic hex meshes

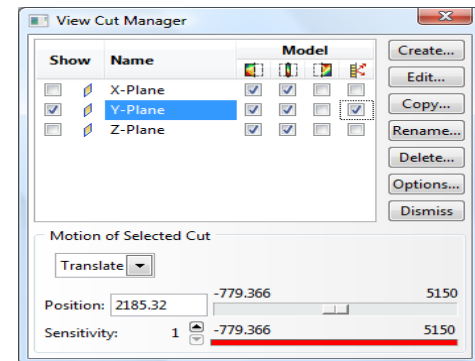

*Automatic virtual topology
removes step-like feature*

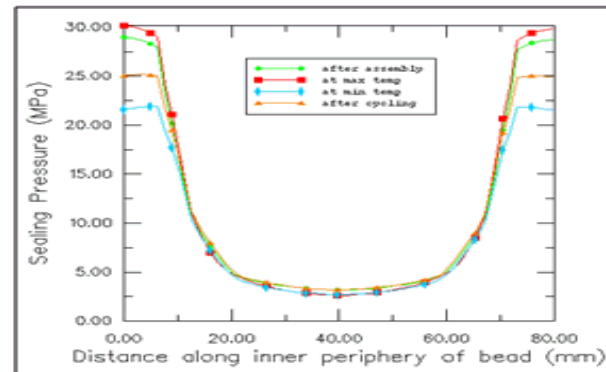

Abaqus/CAE

Preferred tool for visualizing Abaqus results

- High performance for large models
- Transparency
- View cuts
- Probing
- XY plotting
- Much more . . .

(Courtesy of AVL List GmbH)

Abaqus/Standard & Abaqus/Explicit

Abaqus/Standard

- Based on implicit solution techniques
 - Intended for static and structural dynamic events
 - Linear or nonlinear behavior

Clip insertion

Shaft seal insertion

Frequency

Bicycle frame stress

Electrical fuse heating

Tire noise

Gasket sealing

Abaqus/Explicit

- Based on explicit time integration
 - Intended for high-speed transient dynamic events
 - Also suited for highly nonlinear quasi-static events

Deep drawing

Blow molding

Bottle drop

Bottle conveying system

“...the goal at BMW to completely eliminate prototype hardware and testing, such issues can only be subsequently evaluated through simulation.”

Extensive Material models in Standard & Explicit analysis

- Metals, rubbers, and composites
 - Linear/nonlinear elasticity and plasticity
 - Isotropic or anisotropic
 - Rate and temperature dependence
- Additional materials include:
 - Soils and rocks
 - Concrete and ceramics
 - Pastes and polymers
- Damage & failure modeling

Human tissue

Cast iron plasticity

Viscoelastic rubber

Viscous paste

Reinforced concrete

TEST

SIMULATION

Bulk failure

Soil & rock

Awesome contact and joining functionality in Standard & Explicit analysis

JENGA USING ABAQUS

Awesome contact functionality

Advanced joining techniques to
simulate adhesives and delamination

WIPE DISPENSING

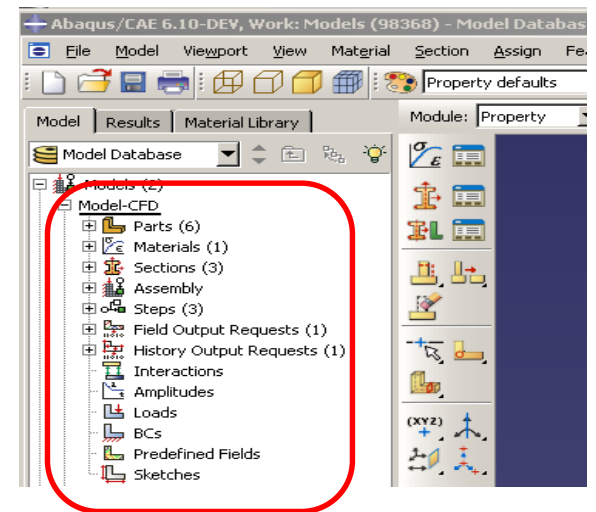

Large deformation with changing
contact conditions

Abaqus/CFD

Abaqus/CFD

- Today: Abaqus/CAE
 - Concept of “model type” in Abaqus/CAE
 - Model type “CFD” enables CFD model creation
- Transient solver, Steady-state solver
- Laminar and turbulent flows

Pre-Processing and modeling support

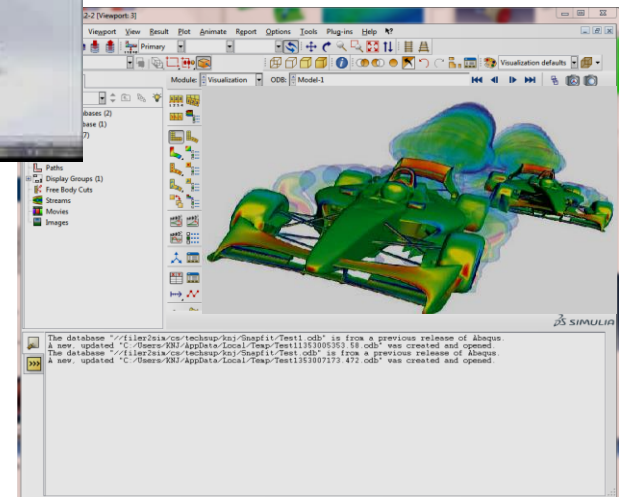

External flow: velocity and vorticity around 35° Ahmed body

Abaqus/CFD

- Co-simulation engine (CSE)
- Couple Abaqus/Standard/Explicit with Abaqus/CFD
- Stabilized segregated FSI algorithm for unstable problems

Native fluid-structure interaction modeling capability

Two powerful but frequently overlooked features in Abaqus

C3D10I: General-Purpose Tetrahedral Element

- I = “Improved Surface Stress”
 - Not Incompatible Modes
- Key features
 - Provides accurate surface stress predictions
 - Suitable for bending-dominated problems
 - Handles incompressible material behavior
 - Works well with contact
 - Some added computational expense
- Benefit
 - Simplifies element selection

Analytical solution:
38,400 psi

C3D10M

C3D10I

C3D10I matches analytical solution

C3D10I: General-Purpose Tetrahedral Element

- Elastoplastic knuckle

Implicit Dynamics

Introduced in Abaqus 6.9EF

- Very good for certain quasi-static problems in which the timescale is measured in seconds but statically unstable
 - Rubber tracks
 - Belt drives
 - “Snap-fit” problems

- Keyword: “*DYNAMIC, Application=...”
 - Quasi-static (for aggressive damping in quasi-static models)
 - Moderate dissipation (for moderate damping— “dynamic” problems for which contact does not need most accurate precision)
 - Transient fidelity (for most accurate solution—truly “dynamic” problems)

- Often a good “standard practice” tool for well-understood quasi-static problems
 - Often a superior solution to quasi-static problems currently being run in /Explicit

Latest capabilities in Abaqus

CEL/SPH/DEM

Coupled Eulerian-Lagrangian Method (CEL)

- Lagrangian elements
 - nodes are fixed within material
 - elements deform as material deforms
 - material boundary = element boundary

- Eulerian elements
 - nodes are fixed in space
 - material flows through elements
 - material boundary is represented by volume fraction
 - Interface reconstruction + advection

Explosion inside a gun barrel

- Eulerian material is ideal gas
- Explosives are modeled with gas inflators inside the barrel
- Contour plot shows Mises stress in the structure

Courtesy of Picatinny Arsenal

Land mine explosion

- JWL + ideal gas (air)
- Rigid structure + deformable plate

Water entry of an all-terrain vehicle

- Water + void
- Rigid structure

Curtain airbag deployment

Courtesy of Takata

Thermal Interaction with CEL

- Extended CEL to thermal stress simulation with contact interactions
 - Complements thermal stress element introduced in Abaqus 6.11
- Applications include forging, mold filling, manufacturing processes, ...

Hot forging

Recent Developments in SPH

SPH Implementation within Abaqus/Explicit

- SPH Concept
 - Mesh-free Lagrangian computational method (incepted in 1977)
 - Continuum modeling method (like FEM) derived in the context of interpolation theory
 - Extreme deformation with fragmentation

- Extremely high deformations problems where CEL is inefficient and Lagrangian FEM is difficult
 - Impact fracture: ballistics, shattering, fragmentation
 - Spraying
 - Snow compaction

Ice Impact Analysis

- Study of Ice balls (hails) impact to construct material model and comparison with experimental data.
- Model derived from *Jeffery Dwayne Tippmann, 'Development of a Strain Rate Sensitive Ice Material Model for Hail Ice Impact Simulation 2011'*
- Uses a Elastic-Rate dependent plastic with tensile failure material definition.

Experimental Set Up

Ice deformation and breakage patterns

Ice Impact Analysis: Mises Stress

*50.8 mm Ice impacting with
an initial velocity of 60 m/s*

Contour of Mises Stress

Ice Impact Analysis: Experiment vs SPH Simulation

(a) $t \sim 91 \mu\text{s}$

(a) $t \sim 135 \mu\text{s}$

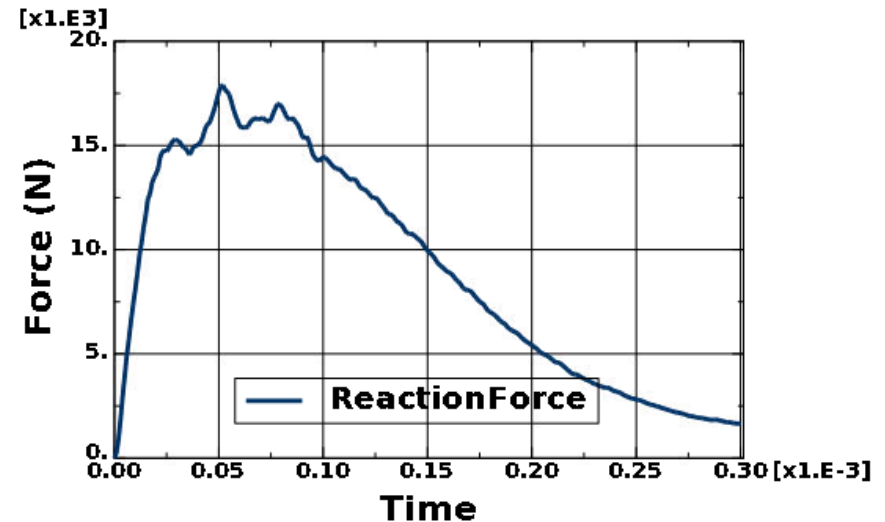

(a) $t \sim 223 \mu\text{s}$

Longitudinal cracking patterns consistent with experiments.

Ice Impact Analysis: Reaction Force-Test vs SPH

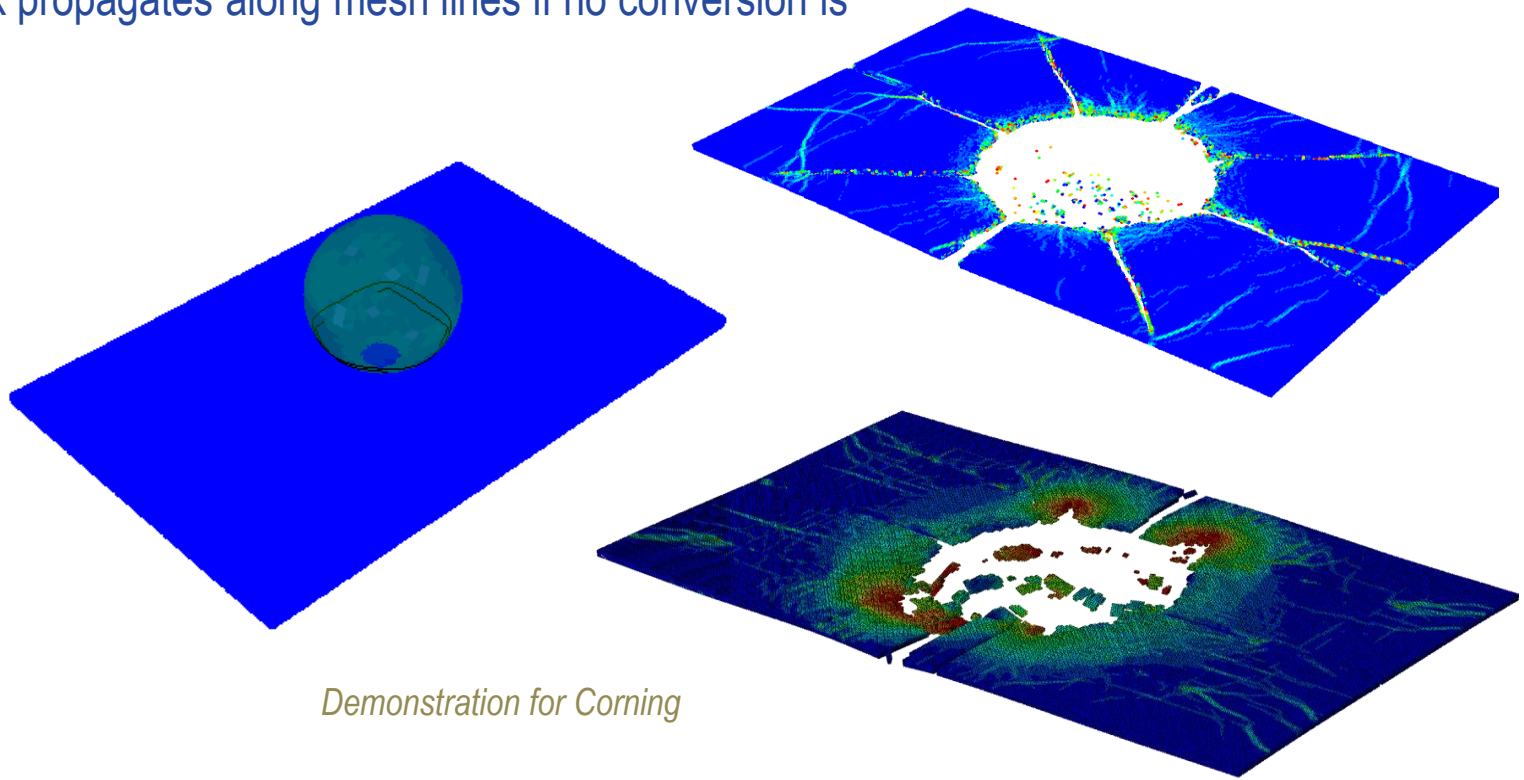

Repeated tests of 50.8mm SHI size at velocities ranging between 59.3 m/s and 62.6 m/s (targeted velocity of 60 m/s)

Abaqus/Explicit Results

Impact: rubber ball impact on a glass plate

- Star-shaped cracking pattern in SPH
- Crack propagates along mesh lines if no conversion is used

Demonstration for Corning

Grease in a CV Joint – Bending shaft

- Grease migrates from one cavity to the next

DEM in Abaqus/Explicit

Motivation for Implementing DEM in Abaqus

- **More frequent requests to simulate particulate media**
 - Often involving interactions with structures modeled with nonlinear FEM
 - Leverage the strong general contact capabilities of Abaqus

Target Applications

Equivalent Plastic Strain Plot

Stresses in the tire

What is new in latest release Abaqus 2016

Advances in general contact

- Improved heuristics for automatically transitioning between different contact formulations can significantly improve convergence behavior in Abaqus/Standard.

*Edge-to-Edge
(supplementary formulation)*

*Edge-to-Surface
(supplementary formulation)*

*Surface-to-Surface
(primary formulation)*

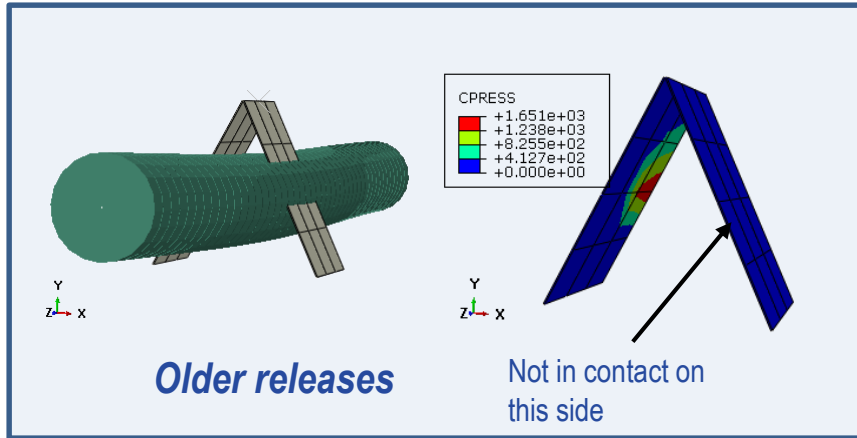

Advances in general contact

- New vertex-to-surface supplementary formulation improves contact behavior at convex corners.

Advances in general contact

- Individual edges can be involved in multiple contacts

Example: Shell wedge bearing down on a beam pinned at its ends

Contact output for Abaqus/Explicit

- CDISP “family” of output variables added
 - COPEN, CSLIP1, CSLIP2
 - New member of this family: **CSLIPEQ** (total slip length)
- CTANDIR output added
 - CTANDIR1, CTANDIR2
 - Vector output of \mathbf{t}_1 and \mathbf{t}_2 local tangent directions
- Slip rate output variables added
 - **CSLIPR1, CSLIPR2, CSLIPRMAG**

Contact output for Abaqus/Explicit

- **CSTATUS** output added

CSTATUS General_Contact_Domain

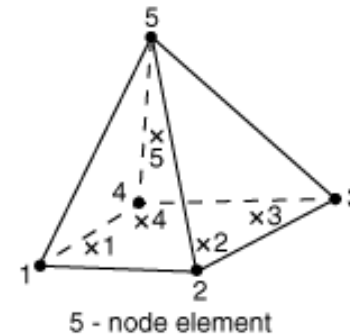

- Closed (Sticking)
- Closed (Slipping)
- Open

Expanded element library

- Pyramid element for stress analysis
 - Compatible transition between tet and hex mesh
 - Highly requested by customers

- Multiphysics elements
 - Coupled temperature-displacement
 - C3D10T, C3D10HT....
 - Coupled pore pressure-displacement
 - C3D10PH, C3D10P...
 - Coupled pore pressure-temperature-displacement
 - C3D10PHT,C3D10PT...

Finite sliding thermal contact

Rigid body rotation of tied solid surfaces

- Abaqus/Standard will by default account for rotations of offsets in solid mesh ties

Similar capability is implemented in Abaqus/Explicit within the framework of surface-based cohesive behavior.

Material modeling enhancements

- Rate dependent nonlinear kinematic hardening plasticity
- Orthotropic clay plasticity for geomechanics applications
- Import of Johnson Cook plasticity for spring back after high rate impact events

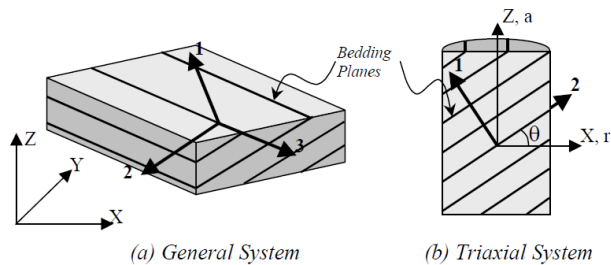

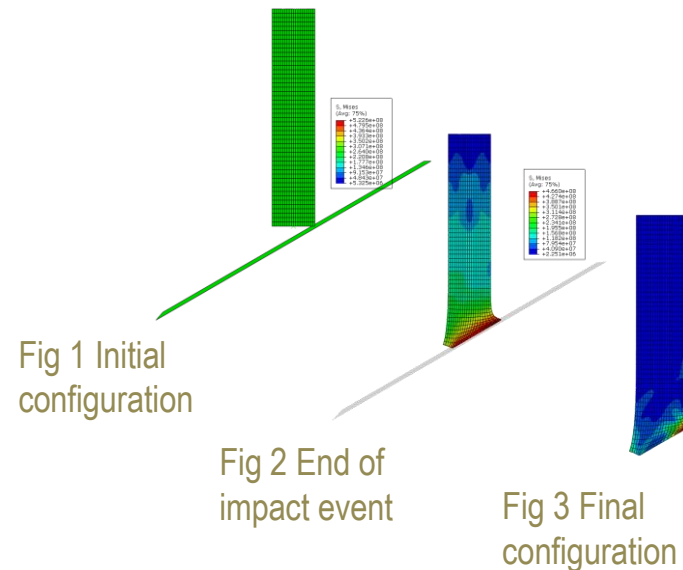

Figure 1. Local Coordinate System Aligned with Bedding Planes

Tracer particles for CEL

- Tracer particles follow the material motion in CEL simulations and allow extraction of material point results.

Tank sloshing example w/ tracer particles

Model	With tracers (seconds)	Without tracers (seconds)
Blast (294k elements, 3400 tracer particles)	1607	1578
Sloshing (13k elements, 2940 tracer particles)	1080	862
Flat airbag (52.5k elements, 1440 tracer particles)	602	582

Minimal impact on performance

DEM particle generation

- Particle generation can now be based on:
 - Evolving inlet surfaces
 - User-specified size distribution
 - User-specified mass flow rate
 - User-specified inlet velocity

Screen Sorter

Expanding inlet

Rotating inlet

Moving inlet

DEM particle interactions

- Simplified specification of Hertz normal contact between particles
- Adhesive contact based upon the Johnson-Kendall-Roberts (JKR) model has been introduced

Comparison of mixing process, without and with adhesion

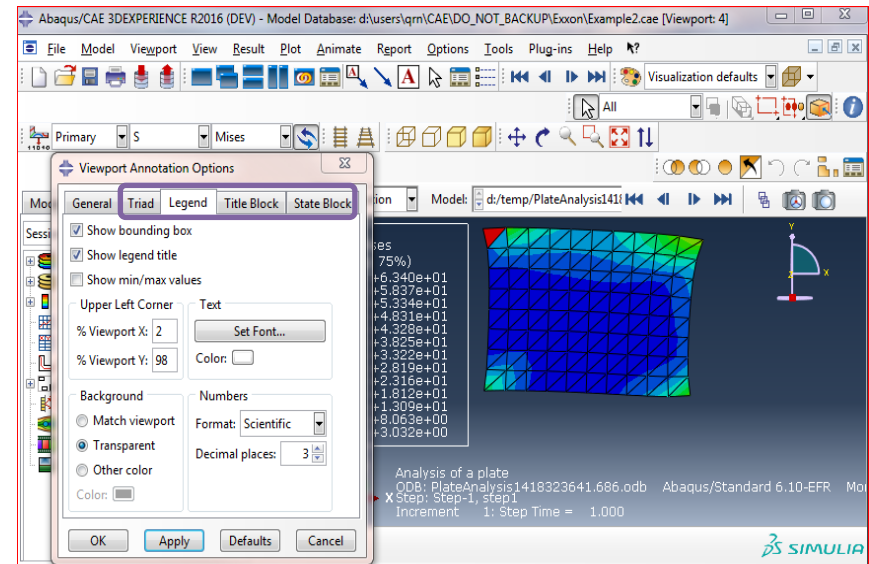

Improved treatment of SPH boundaries

- Introduction of virtual particles improves accuracy of SPH wall conditions.

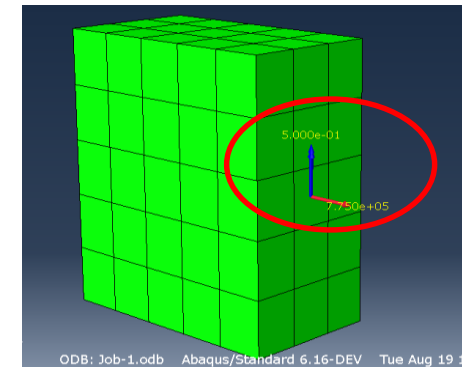

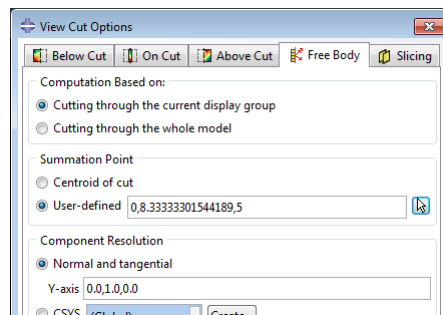

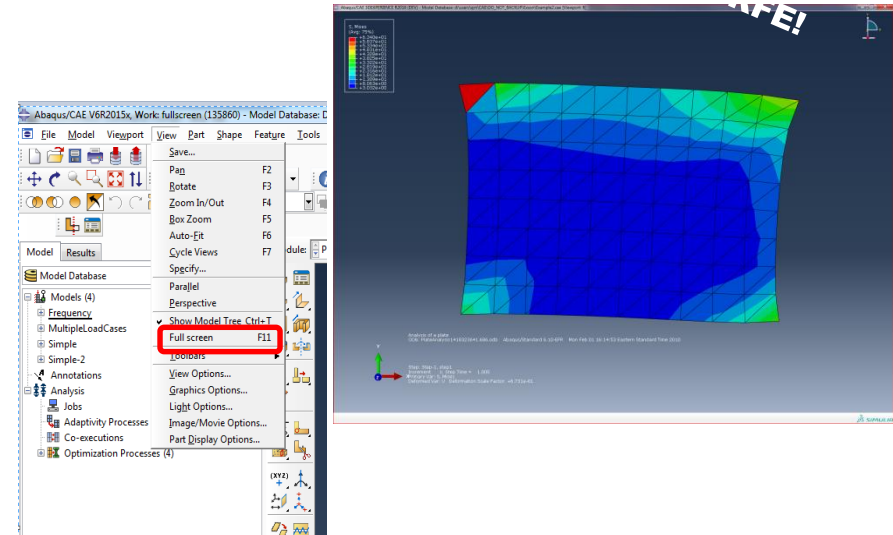

Usability

- Fixed Copy/Paste issues in past releases
 - Copy text from prompt area to clipboard
 - Copy content from GUI widgets and paste the contents
 - ... after closing the widget window!
- Default font and glyph size modified
 - Default font size for legend, title block, state block, x-y plots is increased to 12
 - Default glyph size for Viewer and CAE entities is increased from 6 to 12

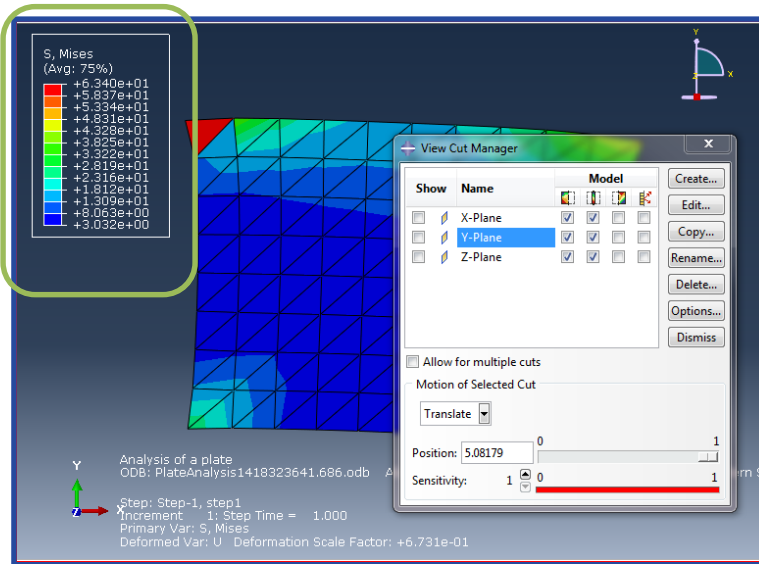

Usability

- Expand viewport to Full Screen (F11)
 - F11 toggles back to default view
- Freebody usability
 - Highlights the location of user-defined summation points
 - Improved default colors of Moment arrows

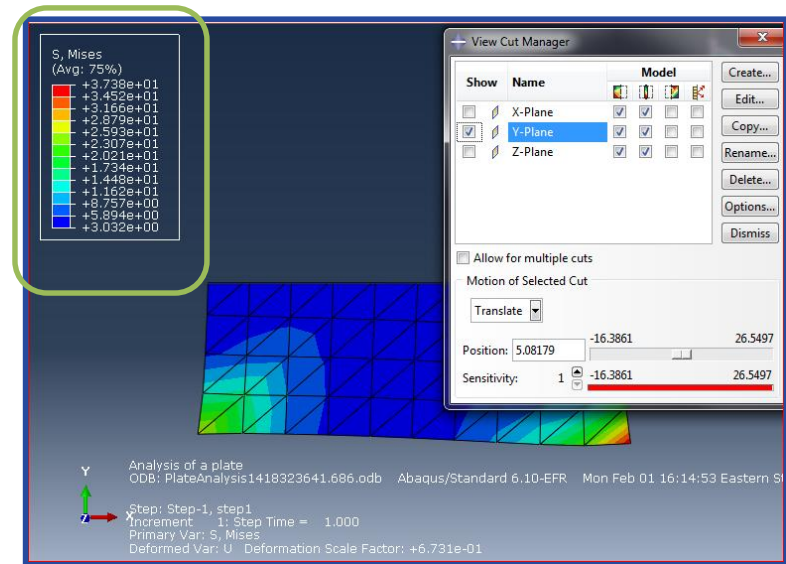

Results visualization

- Update min/max location according to view cut

Min/max location before view cut

View cut with updated min/max location
