

Yoda

Agile Project Management with GitHub

Jens Vedel Markussen, Engineering Manager
Hewlett Packard Enterprise

Introduction

Yoda was developed during 2017/2018 at **Hewlett Packard Enterprise** to support **Agile Project planning** and execution for development of a new innovative product.

GitHub was already in place for **source code versioning** and **issue tracking** (for both bugs and new features).

The ambition was to **enhance GitHub** to become an **all-in-one solution** for Agile Project **Planning** and **Execution**.

Yoda **augments GitHub** by adding **estimates** and **sprint planning** to issues. Further, Yoda brings various tools for **issue-reporting** and **management**.

Yoda was **Open-Sourced** using an **MIT license** in January 2018.

Content

- Agile Project Management
- Stories, Features, Epics, ... in GitHub (issues)
- Sprints in GitHub (milestones)
- Story point estimation in Github Issues
- GitHub issue labelling convention
- Yoda Reporting Tools
 - Issue Time Statistics, CFD, Issue Exporter
- Yoda Agile Project Management Tools
 - Burndown Chart, Velocity Chart, Kanban Board, Release Notes
- Other Yoda tools
 - Milestone Manager, Label Manager, Admin, Task Copy
- Yoda Architecture

Agile Project Management

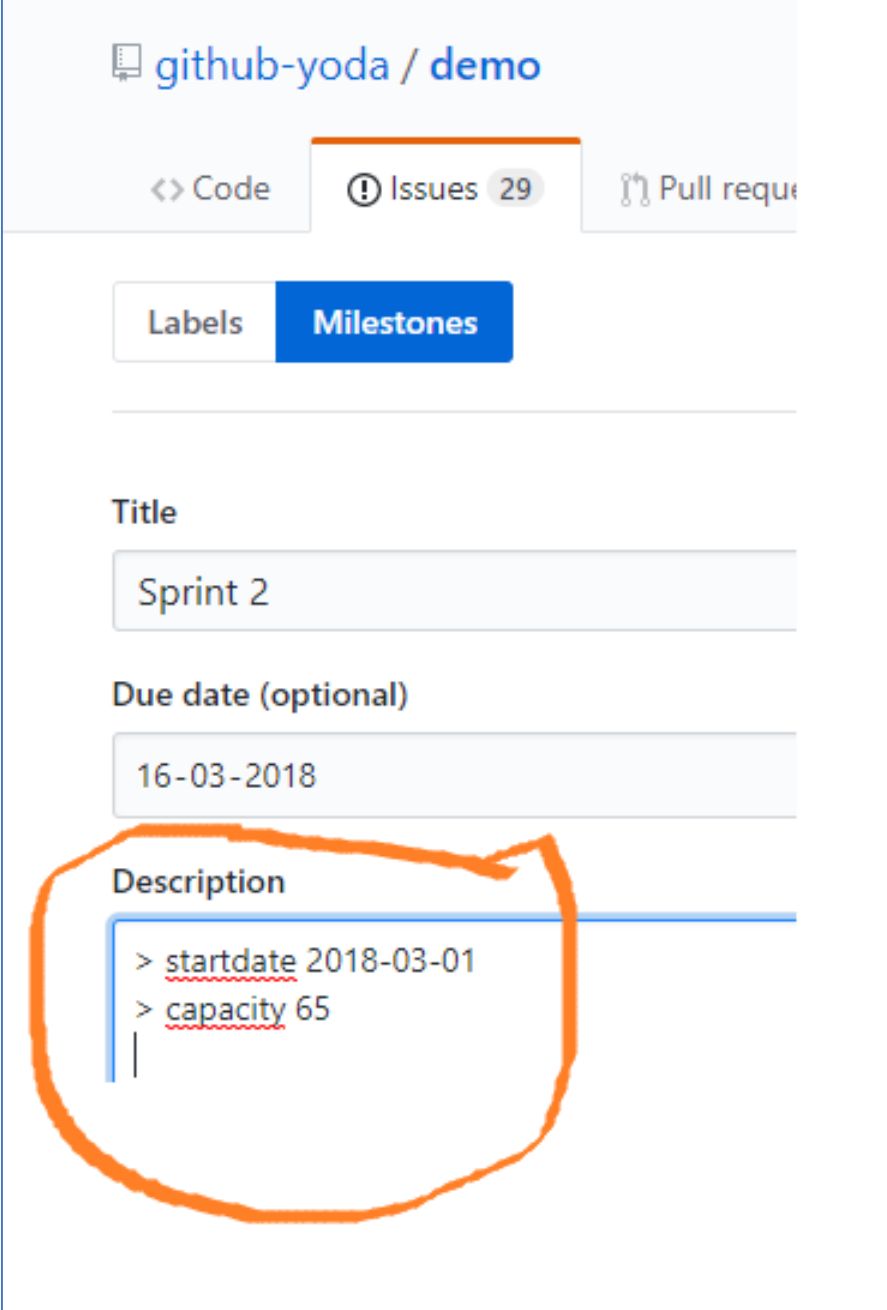

- **Agile** project management is becoming an industry **de-facto standard**
- Project- and product-**development** happens as a series of **sprints**.
- Software is **released** either at the end of each sprint, or every *n'th* sprints as a **Product Increment (PI)**.
- Sprints address (user) **stories**, which are estimates using **story points**.
- Often **SCRUM** methodology drives development.
- Different frameworks, e.g. **SAFe** (Scaled Agile Framework) add descriptions at higher level than (user) stories to capture required functionality (**Epics, Capabilities, Features**).

(User) Stories, etc. in GitHub

- GitHub **issues** can be used to represent (User) **Stories** – and as well Epics, Capabilities, and Features
- GitHub Issues bring many **relevant features** for this, e.g.
 - Web UI, Markdown, graphics, discussions, assignments, labels, lists, file attachments, references, milestones, etc....
- GitHub **issue references** can be used to link descriptions (e.g. stories x and y required to implement Epic z gives references $x \leftrightarrow z$ and $y \leftrightarrow z$).
 - GitHub does not implement as such hierarchies/break-down of issues

Sprints in Github

- A **sprint** defines a time period (typically 2-4 weeks) in which a number of (user) **stories** (as broken down into tasks) are delivered.
- **Yoda** uses Github **milestones** for sprints
 - Milestones already have an end/due date.
 - Yoda expects to have as well a sprint **start date**
 - Optionally, a team sprint capacity figure (in story points)
- Milestones with matching **titles across repositories** are considered to be part of the **same sprint**.
 - This allows **multi-repository** sprint **planning** and **tracking**

```

Story point estimation in Github Issues

- Github issues for (User) Stories **do not have** a dedicated **field** to store estimates (story points).
 - Similarly, no **features** exists for **summing up estimates** (into milestones, projects, etc.)
 - This seems an **obvious omission** from GitHub
- Instead Yoda introduces **two options** for handling **estimates** into issues:
 1. As **special text** "> estimate (story points)", in the body (first comment) of the issue
 2. Using pre-defined fixed **story point labels**.
- If using labels, suggest to create labels with **Fibonacci-like** values (1,2,3,5,8,13,20,40) as typically done for Story Points.
- Yoda considers as well the **remaining effort** for an issue. If not provided, the **remaining effort** is assumed to be **equal** to the **estimate** while the issue is **open**, and **zero** when it is **closed**.
 - If using option 1 above (estimate into issue body), it is possible to specify as well one or more explicit remaining values using a "> remaining YYYY-MM-DD (story point value)" syntax.

Estimate example (body text)

Markdown "> estimate (story point)" format)

Remaining example

Markdown "> remaining YYYY-MM-DD (story point)" format)

The screenshot shows the GitHub issue editor for the issue "Enhance topic list on test systems. #32". The editor has a "Write" tab and a "Preview" tab. The "Write" tab is active, showing a rich text editor with a toolbar. The content of the editor is as follows:

<p>Lorem ipsum orci dictumst fermentum luctus gravida, taciti ultricies bibendum dui vel platea, urna leo vivamus habitasse donec.</p>
<p>Vulputate convallis eget laoreet neque vulputate pharetra etiam purus quis, ad diam potenti elementum rhoncus rutrum aptent maecenas.</p>
<p>Luctus tempor integer inceptos facilisis vulputate amet magna tincidunt mi lacus, lectus porta quam viverra fames platea justo ante.</p>
<p>Aliquam sagittis nullam consectetur tempor tristique habitasse hendrerit posuere, lacus class sem ullamcorper aliquet orci.</p>

Below the main text, there is a list of items, each preceded by a greater-than sign (>). The list is:

- > estimate 30
- > remaining 2017-12-15 22
- > remaining 2017-12-22 14
- > remaining 2018-01-08 4

The list is circled in orange. At the bottom of the editor, there is a message: "Attach files by dragging & dropping, selecting them, or pasting from the clipboard." and a status bar that says "Styling with Markdown is supported". There are "Cancel" and "Update comment" buttons at the bottom right.

Resulting preview/HTML

The screenshot shows the GitHub issue preview for the issue "Enhance topic list on test systems. #32". The issue is marked as "Open" and was opened by "hub-jens" 2 days ago. There is 1 comment. The comment is by "hub-jens" and was posted 2 days ago. The comment content is:

Lorem ipsum orci dictumst fermentum luctus gravida, taciti ultricies bibendum dui vel platea, urna leo vivamus habitasse donec.

Vulputate convallis eget laoreet neque vulputate pharetra etiam purus quis, ad diam potenti elementum rhoncus rutrum aptent maecenas.

Luctus tempor integer inceptos facilisis vulputate amet magna tincidunt mi lacus, lectus porta quam viverra fames platea justo ante.

Aliquam sagittis nullam consectetur tempor tristique habitasse hendrerit posuere, lacus class sem ullamcorper aliquet orci.

Below the main text, there is a list of items, each preceded by a greater-than sign (>). The list is:

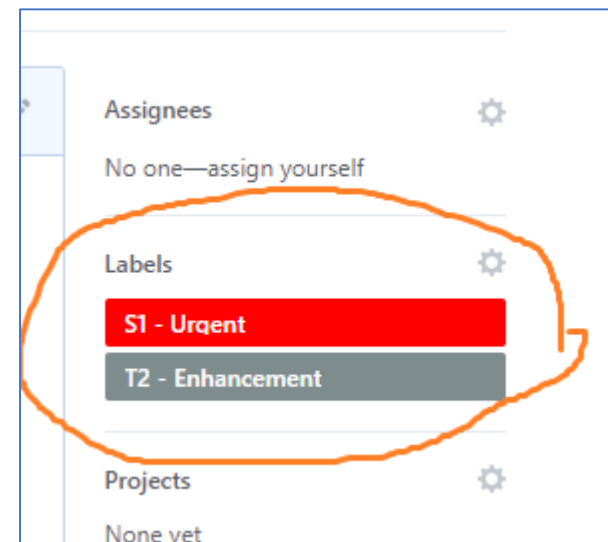

- > estimate 30
- > remaining 2017-12-15 22
- > remaining 2017-12-22 14
- > remaining 2018-01-08 4

The list is circled in orange. The preview shows the rendered HTML for the list items.

GitHub issue labelling convention

- To get maximum benefit from Yoda, it is important to be **consistent** on the **use of labels**. This is best done by having a **labelling** convention.
- Suggestion for a labelling convention is to assign to issues:
 - A **type label** (e.g. Defect, Enhancement, Tasks).
 - A **severity label** (e.g. Urgent, High, Medium, Low).
 - **Note:** These labels are mutually exclusive by convention not enforced by Github.
 - Optionally, use a prefix (e.g. T or S) for different label enumerations.

Example

Yoda Reporting Tools

Issue Time Statistics, CFD, Issue Exporter

Issue Time Statistics

- This report shows open GitHub **issues over time** in a **bar-chart**
- **Scope** can be issues in the **entire organization**, or **one-** or **multiple** repositories
- Issues can be **split** into different **bars** based on **labels** (e.g. Severity)
- Issue **label filters** can be applied
- **Start-** and **end-dates**, reporting **interval**, etc. can be adjusted
- Optionally, number of **opened** or **closed** reports during an interval can be **reported** instead of # of open issues.

Example: Issue Time Statistics

Draw chart

CFD (Cumulative Flow Diagram)

- A **CFD** shows **cumulative** number of **issues over time** split by state (open/closed)
 - **Normally** CFD charts may consider **more than just two states** (e.g. Open, In design, in development, in test, done/closed).
 - As GitHub only has two issue states (open and closed). **Yoda CFD only** uses these **two states**.
- **Scope** can be issues in the **entire organization**, or **one- or multiple** repositories
- Yoda can also draw the related **lead-time graph**.
 - This shows the **average** number of **days** an issue remained in the **open state**.

Issue Exporter

- Yoda Issue Exporter can **export issues** (all or filtered) to a **CSV file**, which can e.g. be **imported** into **Excel**.
- Exporter can export from a **single repo**, **multiple repositories** or across all repos for an **entire GitHub Organization**.
- Set of exported **fields** are **highly configurable**.
- The use of a good **labelling convention** helps (e.g. as the tool supports merging Severity labels into a **single column**).

Release Notes

- Yoda introduces the ability to **generate Release Notes (RN)** based on annotations into issues.
 - A release note entry will contain the issue title, issue number, plus.
 - A more detailed description may be added using the > RN annotation.
 - Markdown formatting can be used
 - The title wording to be used in the Release Note may be overwritten using the > RNT annotation.

Yoda Agile Project Management Tools

Burndown Chart, Velocity Chart, Kanban Board

Burndown Chart

- A **Burndown Chart** is a **bar chart** showing the **remaining effort** over time for a given **sprint**
- An **ideal burndown** line is drawn for comparison
- Yoda uses **remaining estimates** (see earlier) for this purpose.
- **Scope** can be issues **one-** or **multiple** repositories. This allows **cross-repository planning** and **tracking**
- It is possible to attribute some issues as **tentative** (aka **stretch goal**). These will be drawn in Yellow on top of committed issues
- Yoda Burndown tools further includes a **table view** containing the relevant sprint **issues** and their **planning data**.

Burndown Example

	Owner I. _____	Tentative Label P - Tentative	In Progress Label Q - In Progress	Label subtotals ^T[1-9] -	Estimates <input type="radio"/> # issues <input checked="" type="radio"/> In body <input type="radio"/> In Labels	Closed issues <input checked="" type="checkbox"/>	Closed milestones <input checked="" type="checkbox"/>

Velocity Chart

- A **velocity chart** compares the team **velocity across** different **sprints**
- Over time, a velocity chart will **help teams** to set the **correct capacity** for upcoming sprints
- **Scope** can be issues **one-** or **multiple** repositories. This allows **cross-repository planning** and **tracking**
- Yoda does this by reporting per sprint
 - number of **story points** completed
 - story points **per day**
 - story points **vs.** predefined sprint **capacity**

☒

Kanban Board

- A **Kanban Board** shows **sprint activities** across various states, thus allowing an intuitive view of progress
- **GitHub** natively supports Kanban Boards as part of **projects**, where issues can be placed in configurable columns
- **Yoda** does not use this mechanism, but instead supports **Kanban Board** views of issues based on **issue labels** (e.g. Severities, defined Sub-states, issue types)
- **Issues** may be further **filtered** based on **milestones, labels, and assignee**
- Yoda Kanban boards can include **issues** from **multiple repos** inside the same organization.
- **Drag and drop** between columns **change labels** and can close (or reopen) issues
- **Note:** While Yoda Kanban boards provides label and state (open/closed) consistency, GitHub projects do not. Here issue to column is manually maintained.

Label Manager defaults overwrites	Source Repo <input type="text"/>			

Task Copy

- When executing **successive sprints**, you may have **recurring tasks** that you need to execute for **every sprint**.
- These **tasks** should naturally be handled (including estimates) as GitHub **issues**.
- The **task copy tool** allows you to copy such tasks **from one sprint** (milestone) **to the next**.
- If such recurring issues include **tasks lists** (GitHub notation “– [x] text”), **check boxes** will be **cleared** in preparation for the next sprint (so “- [x]” will become “- []”)

Yoda Architecture

Yoda Architecture

- Yoda has a very **simple architecture** based on a few **key principles**:
 1. **All data** will be kept **in GitHub** – no auxiliary database will be used
 2. Yoda **executes** exclusively in the **browser**. Yoda has **no backend**, apart from GitHub.
 3. Yoda **communicates** with GitHub using the **standard API** (version 3)
 4. Yoda tools are written using only **HTML** and **JavaScript**
 5. Yoda uses various **JavaScript libraries**, which are all pulled from the Internet at cdn.com.
- Other **key features**:
 - Yoda can run against any the default **github.com** instance or against any **GitHub Enterprise** instance.

Thank You
