Product History of the ZF 6-speed Automatic Transmission

1999	IAA in Frankfurt: First Prototype of a fully-automatic six-speed transmission
2001	World premiere: Start of volume production for the first automatic 6-speed transmission worldwide, the 6HP26; compared to automatic 5-speed transmissions: weight savings of 13% and 30% less components
2005	Presentation of hybrid system (basis: 6HP26) at the IAA in Frankfurt
2006	Introduction of 2 nd generation of automatic 6-speed transmissions with another 3-6% in fuel savings and even faster shift times (partly below the driver's limit of perception)

Cutaway drawing 6HP26

6HP... Product Family

Improvements of the 2nd Generation

Second Generation of 6-speed Automatic Transmissions

The individual, automatic driving pleasure

Second generation of the 6HP:
Efficiency and increased performance for the leading 6-speed automatic transmission.

- Considerable contribution to CO₂ and/or fuel economy
- Increased power-to-weight ratio
- Optimized shift dynamics and improved subjective driving impression
- Shift times below the driver's limit of perception

Reduction of CO₂ and Fuel Consumption

Further development of shift dynamics (2nd Generation of 6-speed transmissions)

- Shift dynamic is one of the most significant characteristics of the vehicle performance
- The direct shift gearbox has set new standards in shifting dynamics

Improvement shift dynamics

Towing a vehicle

- ⚡ Towing of a vehicle only on its driven wheels at **no more than 70 km/h** road speed and a **maximum distance of 500 kilometres**
- ⚡ Selector lever in **N** (neutral)
- ⚡ If the above mentioned **speed** and **distance limits** are **not respected**, the **automatic transmission** will be severely **damaged**!

Transmission ready to be installed into the vehicle

Transmission to be installed into the vehicle

Handling and Storage of an Automatic Transmission

Handling and Assembling of Automatic Transmission and Engine

Remove converter strap right before assembling the gearbox to the engine

Installation of the Torque Converter

Before assembling the transmission to the engine, it is important that the torque converter is installed correctly (see manual of the special gearbox)

distance from bell housing to
torque converter

measurement of the
distance with a deep gauge

Pump Gear

Driving pins of the pump can break

Effect:

- no power flow (R,D)

Pump Gear

This damage is caused by the wrong installation of the transmission.

Driving pin is broken

Leakage between Engine and Transmission

Effect:

- leakage between engine and transmission

Reasons:

- centre bush is missing in crank shaft
- centre pin between engine and transmission is missing

Centre Bush

centre bush

position of the centre bush

After assembling of the transmission to the engine, don't forget to build in the centre bush!

A missing centre bush cause damages of the torque converter and the oil pump!

Centre Pins

center pin

center pin at an engine case

It is very important that the centre pins are assembled to the engine case.
Missing centre pins will cause damages in the transmission.

The two A describe the position of the centre pins

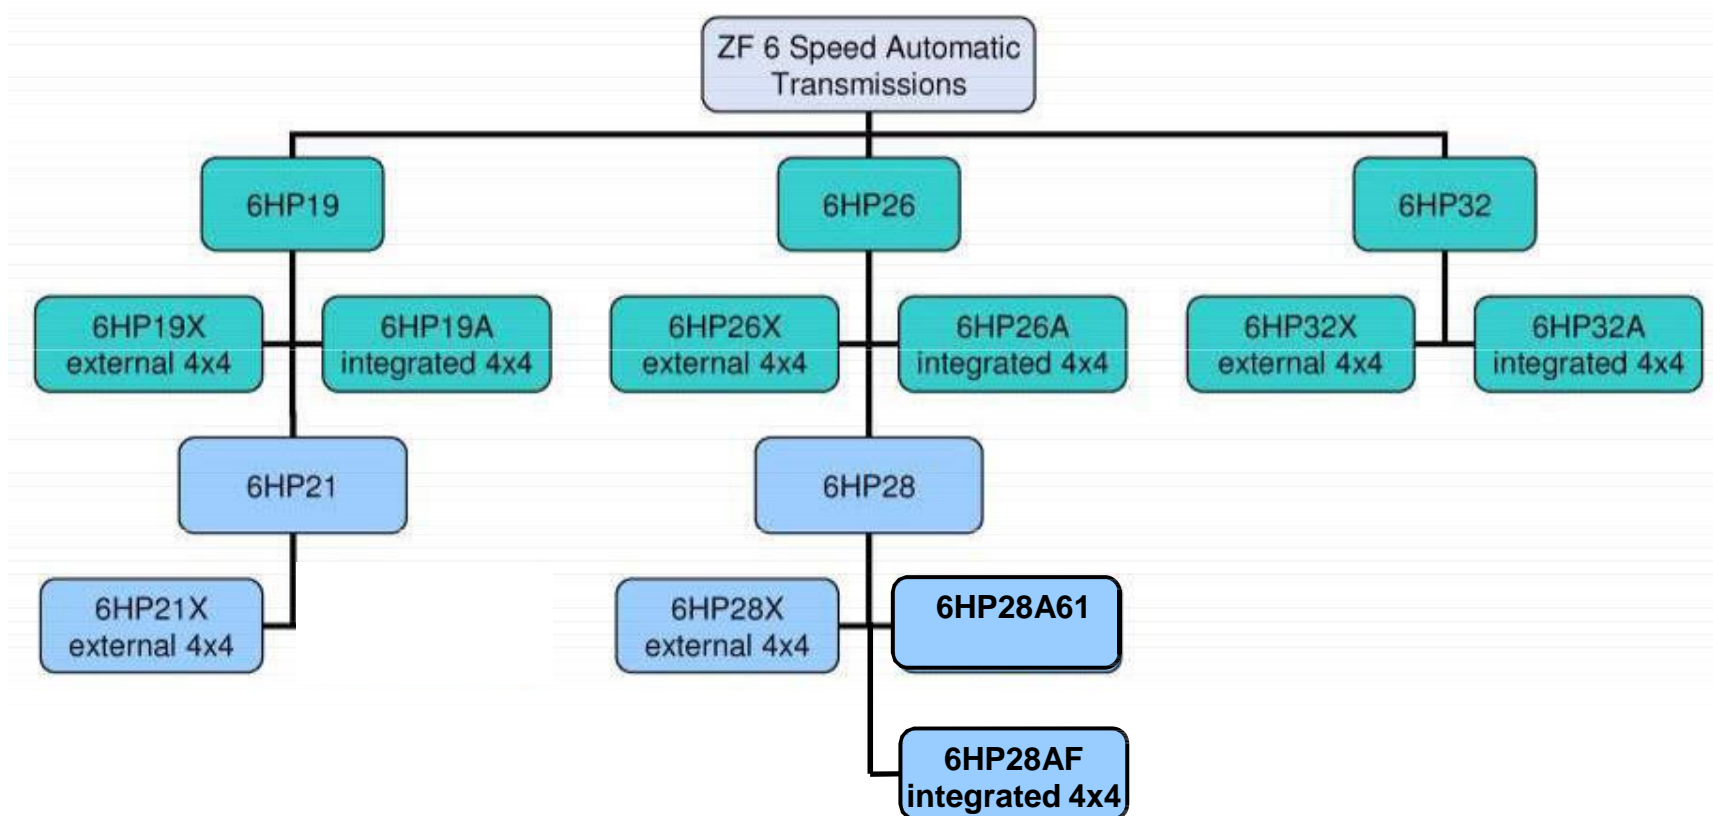

Functional test

- ⌚ After repair you should make a driving test
- ⌚ Before the driving test you have to delete all adoption values using a tester

The whole product family

Mechatronic on a special carrier

6HP..-Mechatronics

left side: E-version / right side: M-Version

Mechatronik identification

 = Main parts list

Mechatronic replacement

1. Secure vehicle against rolling, secure wheels with wheel chocks.
Important: On some vehicles (E-shift) it is necessary to shift vehicle out of Park to replace the mechatronic.
2. Drain transmission fluid and remove the transmission oil pan.
3. Unlock and disconnect the vehicle connector from the transmission.

4. Pull the sealing sleeve locking mechanism to the unlocked position. The locking tab is located on the bottom of the mechatronic below the sealing sleeve.
5. Remove the sealing sleeve.

Mechatronic replacement

6. On E-shift applications only (vehicles with emergency release cable)

Important: By moving the emergency release lever backward the transmission is no longer in the park position. Secure against rolling, apply parking brake and secure **wheels with chocks**.

Use a wire tie or mechanics wire and secure the emergency release lever in a slight backwards position as shown.

Important: During the removal and handling of the mechatronic apply special care not to bump, drop or rough handle the unit especially in the area of the MV2 solenoid.

Mechatronic replacement

7. To remove the mechatronic, remove the screws indicated in blue.

Note: There are mechatronic versions with **10** or **13** mounting screws.
Handle mechatronic with care to prevent external damage.

Mechatronic replacement

8. Remove the mechatronic adapter and replace the seals, coat with transmission fluid and reinstall the seal adapter into the transmission case.

E-shift

M-shift

9. When installing the replacement mechatronic make sure the park cylinder rod on E-shift or the manual valve on M-shift is properly engaged before installing any of the mechatronic mounting bolts.

Mechatronic replacement

10. Use hand tools – Do not use power tools for screw installation.

First install and turn screw **1** and **4** alternately until seated then install all other screws until they make contact with the mechatronic. After all screws are installed, tighten screws in order **1** to **10** or **13** as shown in the schematic below.

Torque for screws is **8 Nm ± 0.8 Nm**.

Mechatronic replacement

11. Unlock the sealing sleeve locking mechanism and install the sealing sleeve with the locating tab properly aligned with the mechatronic. Use transmission fluid to lubricate the seals for installation. After the sleeve is properly seated, push the locking mechanism to the locked position. Install the vehicle connector plug and check that the sleeve is properly seated. The gap x should be between **2.5 to 3.0 mm**.

Mechatronic replacement

12. Install the oil pan and attach all screws until they just make contact with the oil pan. After all screws are installed, tighten screws in order **1** through **21** or **24** as shown in the schematic below.

The tightening torque for screws on a plastic oil pan is **10 Nm \pm 1.0 Nm**.

The tightening torque for screws on a steel oil pan is **12 Nm \pm 1.0 Nm**.

Mechatronic replacement

13. E-shift vehicles, remove the tie strap or wire that held the emergency park release lever in the backwards position and adjust cable as follows.

With the emergency cable released the clearance X indicated above must be adjusted to **1.0 to 2.0 mm**.

The cable should not touch the lever at any time, even if the lever is moved back and forth. If the cable does come in contact then check for a bent lever or a bent cable bracket.

14. Add and adjust transmission fluid level following the appropriate filling procedure.

General Hints on Transmission Oil

- Do not mix different oils unless this is expressly prescribed.
- Clean the oil cooler in the opposite direction from normal flow before fitting the transmission unit, i.e. starting from the transmission feed (VK) and not from the return (ZK). Cleaning unit is commercially available.

6HPxx transmission fluid level procedures

Note: This is a generic 6 speed transmission fluid level procedure. Depending on the transmission, the oil pan and vehicle application there might be different parameters and procedures might apply.

A) Transmissions fluid level checking.

The transmission fluid temperature must be between before checking can begin.

Use test equipment to determine the trans temperature.

The vehicle must be level with engine running.

Step on the brakes firmly, apply parking brake fully, shift to each gear position before shifting back to the Park position.

With the engine running at idle speed and the selector in Park position, remove the filler plug. Monitor the transmission temperature, if a small stream of oil runs out at 40 °C, the fluid level is correct.

If no oil runs out when the filler plug is removed, the fluid level is too low and oil needs to be added until it overflows.

With engine running, install the oil filler plug and tighten to proper torque.

B) Adding fluid after repairs.

With the engine stopped and the transmission in Park position, remove the oil filler plug. Add transmission fluid until a small stream of oil runs out.

Insert the filler plug and tighten by hand. Start the engine.

With the engine running, remove the oil filler plug and add transmission fluid until a small stream of oil runs out. Insert the filler plug and tighten by hand.

Follow the "Transmission fluid level checking" procedure described in section **A)** above.

6HPxx transmission fluid level procedures

C) Notes on fluid level and adding procedure.

Use only ZF-LifeguardFluid6 or OE approved transmission fluid.

If the transmission temperature rises above 50 °C during the fluid level checking procedure the resulting oil level will be too low. Let the transmission cool down and repeat the fluid level procedure.

Have transmission fluid and a suitable oil pump available before starting the fluid level procedure. The transmission fluid temperature will rise quickly during the checking procedure.

D) Drain and filler plug location.

Filler plug **M18x1.5**
Inner hexagon **8mm**
Tightening torque **35 Nm ± 3.5 Nm**

Drain plug **M24x1**
Inner hexagon **10mm**
Tightening torque **8 Nm - 0.5 Nm**

ATF Oil-Check 6HP19 A

Before drive test the ATF have to be filled up with the **ZF Lifeguardfluid 6**

Fill up instruction: The idle speed should be $n_{eng} = 750$ rpm and the transmission oil pan temperature (CGT) 30 ... 50 °C

Oil volume: 9 l transmission oil No. S671.090.255 (yellow)
1,05 l differential oil No. S671.090.163
and 0,528 l Torsen differential oil No. S671.090.163
and 0,022 l Sturaco oil No. S671.090.167
